About enterprise NAS systems
NAS systems create a shared file based storage between enterprise users. NAS exists as an independent network node on the LAN and comprises individual IP addresses. File transfer is achieved through Ethernet connections between users and NAS. It facilitates simultaneous access to multiple users. NAS systems can be used as backup storage in enterprises for archiving and disaster recovery purposes. NAS systems with server mode can also function as a multimedia, database, or print server for SMEs. High-end NAS systems also support RAID technology, which converts multiple HDD into one logical unit. NAS systems are designed and manufactured by several global and local vendors.
Technavio's analysts forecast the global enterprise NAS storage market to grow at a CAGR of 25.85% over the period 2014-2019.
