Top Entry & Exit Control Manufacturer Advances Smart Parking Management Solutions

WUXI, JIANGSU, CHINA, September 20, 2026 /EINPresswire.com/ --

As cities around the world continue to experience increasing vehicle ownership and growing demand for efficient transportation infrastructure, intelligent parking management has become an important component of modern urban development. Within this evolving sector, Wiicontrol Information Technology Co., Ltd. has been expanding its role as a technology-focused provider of parking management equipment and customized solutions. With a product portfolio covering entry and exit control, license plate recognition, parking payment, parking guidance, and related equipment, the company is strengthening its position as a Top Entry & Exit Control manufacturer serving the changing requirements of modern parking facilities.

Parking management has developed considerably beyond traditional ticket-based systems. Parking operators today increasingly seek solutions that can improve vehicle access, simplify payment procedures, provide accurate transaction records, and support more efficient facility management. As a result, automated entry and exit control systems have become increasingly relevant to commercial buildings, residential developments, shopping centers, hospitals, government facilities, transportation hubs, and other locations with significant parking demand.

Wiicontrol Information Technology Co., Ltd. operates within this changing market by combining hardware development with intelligent parking management technologies. According to the company's official information, Wiicontrol specializes in the research, development, and sales of intelligent vehicle networking equipment and provides customized cloud parking solutions. Its product portfolio includes parking entry and exit control terminals, license plate recognition camera terminals, pay-on-foot and pay-on-exit stations, parking meters, parking sensors, and parking locks.

Entry and exit control represents one of the fundamental components of a modern parking management system. The process begins when a vehicle approaches a controlled entrance and continues through identification, access authorization, parking management, payment, and eventual departure. Integrating these functions can help parking operators establish a more structured flow of vehicles while providing users with a more convenient parking experience.

One of the company's key product categories is the LPR Camera. License plate recognition technology can allow a parking system to identify vehicles by reading license plate information, reducing reliance on conventional paper tickets in suitable applications. Wiicontrol describes its LPR solutions as part of its intelligent parking management systems, where license plate information can be captured and transmitted to a management terminal while working with barrier equipment.

The use of an LPR Camera can support ticketless parking configurations in which the license plate becomes the vehicle's parking credential. In such systems, the vehicle's plate information can be recorded when entering a facility, while the corresponding information can later be used to identify the vehicle during payment and exit. Wiicontrol's gated parking system information describes this type of ticketless operation, including license plate recognition, payment, and automated barrier control.

This approach can be particularly relevant to parking facilities seeking to reduce manual procedures. Traditional ticket systems require users to obtain and retain a physical ticket, while ticketless systems can use digital or machine-readable vehicle information as part of the parking process. The appropriate configuration depends on the parking facility, local operating requirements, payment methods, and system architecture.

Payment automation is another important part of modern parking management. Once vehicle access is controlled electronically, parking operators also need efficient methods for calculating and collecting parking fees. Self-service payment stations can help separate the payment process from the exit lane, potentially reducing congestion during busy periods.

Wiicontrol provides the Pay-on-Foot Station as part of its parking payment equipment portfolio. A pay-on-foot system generally allows drivers to complete payment before returning to their vehicles and proceeding to the exit. The company's industry information explains that a typical pay-on-foot parking system consists of an entry station, payment station, and exit station.

The company's Pay-on-Foot Station range includes automated parking payment equipment designed for self-service use. Its official product information identifies applications including residential parking areas, hotels, hospitals, commercial buildings, government facilities, logistics companies, and shopping facilities.

The integration of entry control, vehicle recognition, payment equipment, and exit control can create a more complete parking management environment. Rather than treating each machine as an isolated device, modern parking systems increasingly connect multiple hardware components through software and communication networks. This integrated approach can provide parking operators with more centralized control over vehicle access and parking transactions.

Wiicontrol's product portfolio reflects this broader system-oriented approach. In addition to LPR

Camera and Pay-on-Foot Station products, its official product categories include entry stations, exit ticket verifiers, parking entry terminals, parking exit terminals, lane entry stations, lane exit stations, barrier gates, parking meters, parking sensors, space blockers, enforcement terminals, parking guidance systems, and car parking software.

The company's parking entry terminals illustrate how physical access equipment can be integrated with different identification and communication technologies. Its CP2 series parking entry terminal, for example, supports vehicle detection, optional IC/ID card readers, barcode-related functions, and communication interfaces including RS232, RS485, and TCP/IP. The company also states that the terminal can be integrated with barrier gates and loop detectors from different manufacturers.

On the exit side, Wiicontrol provides parking exit terminals designed to validate parking credentials and support different operating configurations. Its YP2 series is described as compatible with barcode, magnetic-stripe, or combined operations and capable of integration with LPR systems. The terminal supports TCP/IP and RS485 communication, providing options for different parking system architectures.

Compatibility is particularly important for parking operators upgrading existing facilities. Many established parking lots already have barrier gates, sensors, payment systems, or management software in place. A supplier capable of providing equipment that can work with different system components can give operators more flexibility when developing or upgrading their infrastructure.

Customization is another area in which Wiicontrol has positioned itself within the parking technology market. The company's official profile states that it operates research and development departments covering embedded development, software development, and mobile development. It also describes its services as including customized cloud parking solutions and development related to parking management platforms.

Cloud-based parking management is increasingly relevant as operators look for centralized access to parking information. Connected systems can allow management personnel to monitor parking activity, review transactions, manage equipment, and coordinate different functions through software. Depending on the specific architecture, cloud platforms can also support communication between parking equipment and management systems across multiple facilities.

The application scope of intelligent parking systems continues to expand. Wiicontrol states that its parking equipment is used in modern urban streets, intelligent buildings, enterprises and institutions, government agencies, residential communities, and commercial complexes. This range of applications demonstrates the diversity of environments in which automated parking technology can be deployed.

For parking operators, equipment selection involves more than the individual functions of a machine. Factors such as site layout, traffic volume, payment preferences, access control requirements, existing infrastructure, communication protocols, and maintenance considerations can all influence the appropriate system configuration. A comprehensive supplier can therefore play an important role in helping customers match equipment with operational requirements.

The international nature of the parking technology market is also creating opportunities for specialized manufacturers. Wiicontrol's official website states that its parking equipment has been exported to numerous countries and lists markets across North America, Latin America, Europe, Asia, and other regions. The company also reports more than 500 project cases and more than 10 years of experience.

As urban transportation systems continue to become more connected, parking facilities are expected to place greater emphasis on automation, data management, and user convenience. Technologies such as license plate recognition, automated payment, parking guidance, and connected access control can form part of a broader intelligent transportation infrastructure.

Wiicontrol Information Technology Co., Ltd. continues to participate in this development through its integrated range of parking equipment and software-related solutions. Its LPR Camera products address vehicle identification requirements, while its Pay-on-Foot Station products support automated parking payment. Together with entry terminals, exit terminals, barrier gates, sensors, and parking management software, these products contribute to the company's broader approach to intelligent parking management.

The development of modern parking facilities is ultimately connected to a simple objective: making vehicle access and parking management more organized, efficient, and convenient. As parking operators seek to modernize existing infrastructure and develop new smart parking facilities, manufacturers with experience across multiple equipment categories can provide a wider range of implementation options.

With its focus on intelligent vehicle networking equipment, parking access control, license plate recognition, payment automation, and customized cloud parking solutions, Wiicontrol Information Technology Co., Ltd. is positioned within a market that continues to evolve alongside urban transportation needs. Its expanding product portfolio and international project experience provide a foundation for serving parking operators, system integrators, property developers, and other organizations seeking automated parking technologies.

About Wiicontrol Information Technology Co., Ltd.

Wiicontrol Information Technology Co., Ltd. is a technology-focused company specializing in the research, development, production, and sales of intelligent vehicle networking and parking management equipment. The company provides customized cloud parking solutions and a

broad range of products covering entry and exit control, LPR Camera systems, Pay-on-Foot Station equipment, pay-on-exit stations, barrier gates, parking meters, parking sensors, parking locks, parking guidance systems, and related software. Its solutions are designed for applications including urban streets, residential communities, commercial complexes, government facilities, enterprises, and other parking environments. Based in Wuxi, China, Wiicontrol also serves international markets through its parking equipment and customized system solutions. More information about Wiicontrol Information Technology Co., Ltd. and its intelligent parking products is available at [www.wiiparking.com].

Address: #G1-406, 200 Linghu Blv, Xinwu District, Wuxi City, China. 214135
