PlutoSec Grows Its Reach as a Full-Stack Cybersecurity Services Company Serving Toronto and Businesses Across Canada

ETOBICOKE, CANADA, September 29, 2026 /EINPresswire.com/ -- PlutoSec, a cybersecurity services company headquartered in Etobicoke within the Greater Toronto Area, today reaffirmed the operating model that has made it a trusted cybersecurity company Canadian organizations turn to when a single point solution isn't enough. One team covers seven security disciplines. Manual penetration hacking replaces scanner output dressed up as testing. And the senior engineer who scopes an engagement is the same person who runs it through to retest.

The reaffirmation lands at a difficult moment for Canadian businesses. Ransomware and phishing volumes keep climbing, provincial and federal privacy rules keep tightening, and cyber insurers keep asking harder questions before they write a policy. Many organizations respond by hiring a consulting firm built for Fortune 500 procurement cycles, or by patching together two or three narrow local vendors and hoping the gaps between them don't matter. PlutoSec's position is that neither approach fits the businesses actually doing the calling: growing companies that need real testing, real monitoring and real compliance support delivered by people who pick up the phone.

A Cyber Security Services Company Built Around What Was Missing

PlutoSec's founding team spent years sitting across the table from organizations that had already paid for a penetration test and received a repackaged vulnerability scan in return: a list of open ports and outdated software versions, no proof any of it was exploitable and no context for what it meant for the business that had asked. That gap between what companies were buying and what they actually needed is why PlutoSec exists. The standard the team still works by is blunt: if a finding would not survive scrutiny from a skeptical CISO, it does not belong in the report.

That standard shows up in how every engagement runs. Scope, timeline and deliverables are signed before any work begins, so there is no scope creep billed back to the client later. The engineer named at scoping is the engineer who leads the work through to close rather than a name on a proposal who disappears once the contract is signed. And a finding is never marked resolved just because a client says it was patched; PlutoSec retests remediation within 90 days and documents the fix before an engagement is considered done.

Where Bigger and Smaller Firms Fall Short

Canadian businesses shopping for a cybersecurity company in Toronto or elsewhere typically land in one of two camps, and both leave something on the table.

Global consulting brands bring undeniable scale, but that scale comes with Fortune-level minimums, multi-month sales cycles, and engagements frequently staffed by rotating junior consultants working under a partner's name. Reports lean on frameworks and checklists first and exploitable findings second, and a mid-market business rarely gets the senior attention its budget would suggest it is paying for.

Smaller and single-service local providers solve a narrower problem well and only that problem. A shop that only runs a security operations center cannot also test a web application before launch. A firm that only tests applications has no answer when a client needs SOC 2 evidence for a customer contract next quarter. Businesses end up managing three or four vendor relationships, translating between them and hoping nothing falls in the cracks, all while several providers stay vague about basic questions like guaranteed response windows or where retesting fits into the price.

PlutoSec was built to close both gaps at once: enterprise-grade methodology and certification,

delivered with senior led attention and mid-market pricing, with every discipline a growing business needs sitting inside one engagement instead of four separate contracts.

Every Discipline, One Engagement

PlutoSec now delivers seven full service lines from a single engagement team, each mapped to recognized frameworks including OWASP, NIST, PTES, and MITRE ATT&CK.

Offensive Security

Covers the work most people mean when they say penetration testing. Certified engineers carry out manual penetration hacking assessments across web applications, APIs, networks, cloud environments, mobile apps, and Active Directory, plus external and internal penetration testing, red team exercises, and wireless testing, with every finding proven by hand under a zero false positives guarantee rather than assumed from a scan.

Managed Cybersecurity Services

PlutoSec's managed cybersecurity services give clients 24/7 coverage through the company's security operations centre, including SIEM monitoring, managed detection and response, log management, and ongoing threat detection, with real analysts triaging real alerts rather than a dashboard nobody watches after hours.

Cloud & Infrastructure Security

Hardens the platforms modern businesses actually run on, including AWS, Azure, Google Cloud, and Microsoft 365, through IAM reviews, Zero Trust architecture work, and infrastructure hardening that closes the misconfigurations attackers look for first.

Compliance & Risk Management

Builds the audit-ready evidence boards and auditors ask for, spanning ISO 27001 readiness, SOC 2 Type II readiness, PCI DSS assessments, and HIPAA and PHIPA security reviews, backed by risk assessments and third-party vendor reviews.
Secure Application Development

Builds security into the development process itself, from secure web application development and secure mobile app development to API development and DevSecOps integration, so protection is designed in rather than patched on after launch.

Secure Hosting & Infrastructure

Covers managed VPS hosting and secure cloud hosting, with server hardening, WAF and DDoS

protection, SSL/TLS management, and backup and disaster recovery built into every plan.

Incident Response & Digital Forensics

Steps in when something has already gone wrong, delivering cyber incident response, ransomware investigation, malware analysis and digital forensics to contain an incident, establish root cause and get operations back online.

A full breakdown of every service line is available on PlutoSec's services page.

Credentials That Hold Up When It Matters

PlutoSec is a CREST-accredited firm and holds ISO 27001 and GPEN certification at the organizational level with individual team members carrying OSCP, CISSP, CEH, CISA, CompTIA Security+, AWS Certified Security Specialty, and CCSP credentials. Engagements map to OWASP, NIST, PTES, MITRE ATT&CK, MITRE ATLAS, and Canada's ITSG-33, so results hold up with auditors, boards and cyber insurers not just the team that produced them.

Nearly a decade in, the numbers back up the approach: over 100 clients served, a 4.8 out of 5 average client rating across more than 200 verified reviews, and 76+ reviews on Clutch alone. The firm carries professional liability insurance, hosts client data within Canada to maintain data sovereignty and signs an NDA before any scoping conversation begins.

How an Engagement Actually Runs

Every client goes through the same five steps: discovery and scoping to define what's in play, testing and assessment that blends manual technique with the right tooling, a two-track report (technical detail for engineers, a plain-language summary for leadership), remediation support until issues are actually fixed and a final retest that confirms the gaps are closed. Many clients continue on a rolling basis rather than treating security as a once-a-year project. The full methodology is outlined on PlutoSec's Why Us page, alongside the certified engineers behind it on the team page.

Built for Regulated Industries

PlutoSec's client base spans organizations across Canada in:

- Finance

- Healthcare

- Retail and ecommerce

- Government

- Technology

- Utilities and energy

Each engagement is scoped to that sector's specific threats and compliance obligations. A full breakdown of industry-specific work is available on PlutoSec's industries page.

In Their Own Words

“Too many businesses have been sold the idea that a scanner output with a cover page counts as a penetration test,” said a senior member of PlutoSec's offensive security team. “We built this company to prove that manual, senior-led testing doesn't have to cost enterprise money or run on enterprise timelines. Toronto businesses deserve the same rigor the big firms reserve for their biggest accounts.”

Available Now

PlutoSec is accepting new engagements for organizations across Toronto, the Greater Toronto Area, and Canada more broadly. Businesses can book a free consultation, call +1 (905) 367-6038, or email contact@plutosec.ca to scope a first project. Full service details, client case studies, and city-by-city coverage across Canada are available at plutosec.ca. More on the team and the company's approach is available on PlutoSec's site as well.

About PlutoSec

PlutoSec is a Canadian cybersecurity services company headquartered in Etobicoke, Ontario, providing manual-first penetration testing, managed cybersecurity services, cloud and infrastructure security, compliance and risk management, secure application development, secure hosting, and incident response and digital forensics to organizations across Canada and internationally. The company holds CREST accreditation, ISO 27001 certification, and GPEN certification, with engineers certified in OSCP, CISSP, CEH, and related disciplines. PlutoSec has served over 100 clients across finance, healthcare, retail, government, energy, and technology, maintaining a 4.8 out of 5 average client rating. Learn more at https://plutosec.ca.
