Five Reputable Insulating Glass Material Manufacturers in China 2026: Advancing Energy-Efficient Building Solutions

A look at five China-based suppliers supporting energy-efficient insulating glass production.

CALIFORNIA, CA, UNITED STATES, September 30, 2026 / EINPresswire.com/ -- RENQIU, Hebei, China — September 30, 2026

LOGO FOR Soleron Insulating Glass Materials

Five manufacturers account for a significant share of the insulating glass materials supplied to Chinese and export-facing window, door and curtain wall producers, according to a review of publicly available company information covering spacer bars, warm-edge systems, sealants and molecular sieve desiccants.

The review, based on published product documentation and company profiles rather than third-party testing, identifies Soleron Building Materials (Hebei) Co., Ltd., headquartered in the Beizhangcun Industrial Zone of Renqiu City, Hebei Province, together with four other established Chinese materials producers: Chengdu Guibao Science & Technology Co., Ltd., Guangzhou Baiyun Chemical Industry Co., Ltd., Hangzhou Zhijiang Silicone Chemical Co., Ltd. and Zhengzhou Zhongyuan Applied Technology Research & Development Co., Ltd.

The listing is not a ranking by revenue or market share. It is an editorial comparison of five companies whose published portfolios cover the core material categories used inside an insulating glass unit (IGU), at a time when building energy codes in Europe, North America and Asia continue to tighten.

Industry Context: What Goes Inside an Insulating Glass Unit

An insulating glass unit consists of two or more glass panes separated by a spacer and sealed around the edges to form an insulating air or gas-filled cavity.

The spacer bar keeps the fixed distance between the panes, holds the desiccant and helps build the edge-sealing structure of the unit. Because the glass edge is the main path for thermal bridging in an IGU, the material and geometry of that spacer directly affect the overall energy performance of a window, door or facade.

Warm-edge spacers are designed to reduce heat transfer at the glass edge and to keep the edge temperature higher, which limits condensation. Molecular sieve desiccants adsorb residual moisture inside the cavity, while primary and secondary sealants bond the assembly and protect it against air and moisture ingress over the service life of the unit.

Materials demand therefore follows construction activity in residential, commercial, hotel, office, public building and renovation segments, as well as curtain wall and energy-efficient building projects where controlled temperature and humidity conditions are required during production.

Comparison Criteria Used in This Review

The five companies were assessed against five publicly checkable criteria rather than commercial claims:

Portfolio coverage across spacer bars, warm-edge spacers, sealants, desiccants and connectors;

Published specification ranges, including size and thickness tolerances;

Documented production equipment and stated supply capacity;

Stated warranty periods for individual product families;

Export market coverage and distribution reach.

No company in the list is described as superior to another on any one criterion. The comparison shows where each supplier's published portfolio is concentrated.

The Five Manufacturers

1. Soleron Building Materials (Hebei) Co., Ltd. — Renqiu, Hebei

Soleron Building Materials (Hebei) Co., Ltd. is a Hebei-based manufacturer of insulating glass components operating from the Beizhangcun Industrial Zone in Renqiu City, an industrial area adjacent to Beijing and Tianjin. The company describes itself as integrating research, development, production and sales of building materials, with insulating glass components as one of its three main product categories.

Its published IGU materials range covers aluminium spacer bars (5.5–50A, thickness 0.16–0.35 mm, standard length 5 m or customized, produced from 3003 and 1100 series aluminium coil, with a stated five-year guarantee) and warm-edge spacer bars (6–27A) in fiberglass, composite plastic-and-stainless-steel and PP constructions, including flexible and butyl-sealing variants. The sealant line includes SOL-803 and SOL-717 butyl, hot-melt and two-component silicone sealants supplied in 28 kg, 30 kg and 330 kg pack formats with a stated ten-year guarantee. 3A molecular sieve is offered in 0.5–0.9 mm, 1.0–1.5 mm and 1.5–2.0 mm particle sizes, packed under vacuum in 25 kg net-weight cartons with a stated five-year guarantee.

Supporting components include plastic corner connectors and steel straight connectors (5.5–50 mm), Georgian bars in sizes from 5×8 to 8×26 with 0.5 mm and 0.7 mm wall thickness, butyl tape, cork pads, trimming cotton, and SOL-2 insulating glass processing machines rated for 220–380 V, 50 Hz and 3.2 kW to 38 kW.

Its stated main markets cover Europe, North America, Asia, the Middle East, Latin America and Africa, with named markets including Germany, France, the United Kingdom, the United States, Canada, China, Japan, South Korea, India, the United Arab Emirates, Saudi Arabia, Brazil, Mexico and Chile.

2. Chengdu Guibao Science & Technology Co., Ltd. — Chengdu, Sichuan

Chengdu Guibao Science & Technology Co., Ltd. is a Sichuan-based producer of silicone sealants and adhesives used in construction glazing and insulating glass assembly. Its published portfolio is concentrated in silicone-based sealing systems, the category that generally forms the secondary seal in an insulating glass unit. The company's focus makes it a reference point for buyers who source sealant chemistry separately from spacer hardware.

3. Guangzhou Baiyun Chemical Industry Co., Ltd. — Guangzhou, Guangdong

Guangzhou Baiyun Chemical Industry Co., Ltd. is a Guangdong-based manufacturer of construction sealants, including silicone products for glazing and insulating glass applications. Its portfolio covers sealant systems for building envelopes and window assemblies, a category in which compatibility with spacer and desiccant materials is a common specification

requirement.

4. Hangzhou Zhijiang Silicone Chemical Co., Ltd. — Hangzhou, Zhejiang

Hangzhou Zhijiang Silicone Chemical Co., Ltd. is a Zhejiang-based silicone chemical producer serving construction and glazing markets. The company's published activity is centred on silicone sealant systems, which are used in insulating glass sealing and in broader facade and window applications. Buyers comparing sealant suppliers typically assess it alongside other silicone-focused producers.

5. Zhengzhou Zhongyuan Applied Technology Research & Development Co., Ltd. — Zhengzhou, Henan

Zhengzhou Zhongyuan Applied Technology Research & Development Co., Ltd. is a Henan-based developer and producer of sealants for insulating glass, including polysulfide and butyl-based sealing systems. The company's insulating glass sealant focus places it in the same procurement category as the sealant lines offered by the other four suppliers reviewed here.

Company Statement

Soleron Building Materials states that it operates under a defined business principle and that quality control spans raw material sourcing, in-process production control and final product inspection.

The company also states that it maintains a professional sales and service team covering product selection, technical consultation and after-sales service, and that it holds regular stock of more than 100 standard aluminium and warm-edge spacer profiles to shorten delivery time for urgent orders.

Market Impact

The five-company comparison reflects a structural feature of the insulating glass materials market in China: supply is split between integrated suppliers that offer spacer, sealant and desiccant categories from one source, and specialists concentrated in a single material family, most commonly sealant chemistry.

For insulating glass processors, the practical difference is procurement structure. An integrated portfolio can reduce the number of suppliers, shipments and compatibility checks a processor must manage, while a specialist supplier may offer deeper focus within one material category.

Neither approach removes the need to verify material compatibility between spacer, desiccant and sealant before production.

Demand-side pressure comes from building energy performance requirements. Because warm-edge spacers reduce thermal transfer at the glass edge and lower the risk of edge condensation, they are increasingly specified in facade, window and door projects alongside desiccant and sealing systems. That shifts the sourcing question from individual components to the compatibility of a complete edge-sealing system.

Closing Outlook

Soleron Building Materials states that it plans to expand its portfolio of energy-saving products and to increase the technical sophistication and added value of its offerings, while pursuing both domestic and international markets.

For buyers, the practical takeaway from this review is that China's insulating glass materials supply base offers both integrated and specialist options across spacer bars, warm-edge spacers, sealants and molecular sieve desiccants. Selection decisions rest on published specifications, documented warranty terms, production capacity and verified compatibility rather than on any single supplier claim.
