The e-cigarette was first introduced in the market in 2007 with the aim to help the smokers to avoid the dangerous

effects of smoking. Medical studies found that traditional cigarette contains some harmful ingredients that have some dangerous effects on health and can increase the chances of various diseases such as lungs cancer. To avoid such harmful effects, experts developed the Nicocure, the brand of e-cigarette that has clinically proven safe and best alternative to the traditional cigarette and can be helpful to quit smoking.

It is very difficult for a chain smoker to quit smoking. Studies found that cigarettes contain over 4000 toxic chemicals and carcinogens. Experts designed electronic cigarettes which actually deliver nicotine through water, and allow the user to exhale only vapor. Nicocure is designed with a sensor in it which senses the motion when user sucks one end of the nicocure. The sensor then starts the heater which heats the liquid inside it. That liquid contains nicotine and propylene glycol. On heating vapors are produced and the user actually inhales these vapors.

Furthermore, Nicocure doesn't produce smoke and ash like the traditional cigarette therefore it can be used anytime and anywhere because it doesn't cause any negative effects on health as well as on environment. The product is approved by the health experts, however new customers can read more about the product at the official website before using it.
