

# PathXL Wins Three Major Cancer Centers in the US

*Mayo Clinic, Cleveland Clinic and UCLA are three of the latest organizations to join the PathXL customer base in North America.*

BEL AIR, MD, USA, October 7, 2014 /EINPresswire.com/ -- Investing heavily in the North American market, [PathXL](#) has gained substantial recognition by winning three of the 15 Top Cancer Centers in the USA - Mayo Clinic, Cleveland Clinic and UCLA. These three institutions will benefit from PathXL's solutions for digital pathology.

PathXL is a global pioneer in the use of web-based solutions for Digital Pathology

PathXL® has a portfolio of platforms for Research, Education and Clinical environments, ranging from the managing, viewing and annotating of digital slides, to solutions for compiling and searching large datasets and image repositories. PathXL also delivers an expanding set of complex algorithms capable of identifying tumor tissue for a number of different cancer types.

Mayo Clinic, one of the largest integrated not-for-profit medical group practices in the world, has recently acquired PathXL's solution for storing, sharing and scoring tissue macroarrays. PathXL's TMA software works as an efficient solution for histopathology, IHC and FISH analysis on tissue microarrays. The dearrayer and map are a substantial help in keeping track of where pathologists are on the slide and exactly what they are looking at, without having to move the slide. This will therefore provide Mayo a simpler, faster way of scoring their TMAs and improve their overall workflow.

Cleveland Clinic is another high-profile Institution, which will soon begin building a brand-new Cancer Center on their main campus – an investment of over \$275 million. Cleveland Clinic has chosen PathXL's [TissueMark®](#) software, for automated tumor detection on H&E stained digital slides, to assist them with molecular analysis and biomarker discovery.

As an institution with a major focus on research, Cleveland Clinic expects to have accurate and consistent results for every single sample. Their team found TissueMark to be a valuable aid in streamlining the analysis of tumor tissue, as the software automatically marks up the boundaries for dissection and provides a calculation of the tumor percentage contained within that region. This process will play an important role on freeing Cleveland Clinic's highly qualified

staff from tasks technology can now reliably carry out, thus allowing them to spend more time interpreting those results.

Scott W Binder, Senior Vice Chair and Director of Pathology Clinical Services at UCLA, was one of the first to publicly welcome TissueMark, stating that “this new technology will bring new levels of efficiency and accuracy to tissue annotation.”

Now, UCLA has trusted PathXL with the handling of their telepathology outreach, including the use of PathXL’s Digital Pathology Workflow platform to facilitate the reading of consult cases from China, which eliminated the need for pathologists to be in possession of the actual slides. These slides will now be kept in-house but digitally available for consultation purposes, whenever needed.

Similarly, the David Geffen School of Medicine will be counting on PathXL Tutor to build content based on virtual slides, which can include different modules, made available to the students according to the professors’ preferences and course plan.

Des Speed, CEO of PathXL, commented: “At PathXL, we have the ambition to be the best in the world at what we do. We are delighted that such prestigious USA organizations have chosen PathXL software for their Digital Pathology needs – further reinforcing the great progress that is being made by our North America team. We will have much more news like this in the months ahead.”

PathXL’s business in the United States has been growing exponentially and the company has recently held an exclusive event in Boston to promote their newly launched platform, [Xplore](#). A similar event is due to be held in October, in San Francisco, including new additions to what was first introduced early this year at the European Society of Pathology Annual Congress, in London. PathXL’s award winning product, TissueMark, is also due to see its algorithm portfolio extended soon, with prostate to join the existing breast, colorectal and non-small cell lung carcinoma algorithms.

#### About PathXL

PathXL is a global pioneer in the use of web-based solutions for digital pathology, and provides innovative software for use in drug discovery research, clinical sectors, biomarker analysis and education. Their product for the automated identification and annotation of tumour tissue, TissueMark, was awarded Frost and Sullivan 2014 European New Product Innovation Award for Automated Image Analysis for Digital Pathology. PathXL has just launched Xplore – a new application for image and data management, aiming to facilitate studies for Researchers worldwide.
