

OUCH! Skin Can Be a Painful Organ!

Treat the largest organ of the body with some Zinc, Lidocaine and Camphor.

BARRINGTON, IL, USA, August 28, 2015 /EINPresswire.com/ -- Having a beautiful, radiant and flawless skin is everyone's dream. However, certain skin conditions can be extremely painful and uncomfortable. Some of the most painful skin conditions are shingles, rashes, poison ivy, abrasions, burns, acne, eczema, and even cracked cuticles. Skin, unknown to most people, is the largest organ of the body. When your skin is not feeling well, it can be debilitating causing missed work days and missed social events. Treating the skin naturally with zinc is helpful in healing the skin by providing the building blocks for skin structure. Adding the benefits of lidocaine or camphor gives relief and comfort while the skin heals. Lidocaine temporarily numbs the nerve endings which can be a lifesaver for

EPizyn Gel in Package

people with shingles, burns, venous ulcers, and any condition where nerves are exposed or excitable. Camphor has a calming effect that gives relief for conditions like hives, poison ivy and any time the skin is swelling or reacting to the environment. These added benefits means less touching of the affected areas too, which will help speed the healing process.

[Epizyn](#) just released two new formulas with Lidocaine and Camphor to give relief in most skin conditions. The main element in Epizyn is Zinc Gluconate which provides the building blocks of skin structure. Taurine and L-lysine are the other components that are added for activating deep penetration to carry the zinc across cellular membranes at extremely high levels to offer benefits not seen from other products. The product is safe for use on any part of the body and can be used around the eyes as well.

Most skin conditions are treated with the help of steroids. However, steroids are extremely harmful for the body especially during prolonged usage. They can also aggravate the skin problems or make way for new problems thereby resulting in skin thinning, resistance to other steroid therapies, allergies and even Cushing's disease. Epizyn is a natural skin care that comes in the form of gel and spray. This product can be the best solution for chronic conditions that need medical aid without any inhibitions or side effects.

About Epizyn

Epizyn is the only non-steroidal stabilized zinc gluconate that is currently available in the market today. This product is safe, natural solution that treats major skin problems which are otherwise treated with the help of steroids. Epizyn has excellent pharmacokinetic properties that increase the systemic circulation of zinc in the body thereby helping the skin restore back to its natural state.

HOW ZINC HEALS SKIN...

Vitamins are great, but your body needs a certain dose of minerals too! Zinc is an essential mineral that is difficult to get enough of through food.

According to the NIH the top 5 foods highest in zinc are:

- Oysters
- Beef Chuck Roast
- Alaska King Crab
- Broiled Beef Patty
- Cashew

How do you get zinc into your body?

To be highly effective zinc needs to penetrate on a cellular level.

Zinc helps to heal:

- Cuts
- Scrapes
- Itches
- Acne
- Scaling
- Dryness
- Cracking
- Infections
- Colds
- Sunburns/burns

HEAL

Skin should be treated topically and internally with zinc.

Ancient Egyptians used the healing power of zinc.

How? What zinc should I use for healthy skin and immune system?

Topical zinc needs to penetrate the skin. Use zinc gluconate with leucine and lysine to penetrate the cells.

There are many forms of zinc. Absorption is the main goal. Internally it is recommended to use one of the following:

- Zinc picolinate
- Zinc citrate
- Zinc glycinate
- Zinc acetate
- Zinc monomethionine

Epizyn Zinc Gluconate is safe for around the eyes and oral use.

HEALING STAGES

All wounds heal in 3 stages. Zinc gives the skin tools to help heal faster with less granulation.

1 First Stage: INFLAMMATORY - In the first few days the area tries to restore its normal state. This includes pH balance, constriction of blood vessels. Deeper wounds will see clotting of platelets and thromboplastins. Redness, swelling and heat are indicators of the immune response. White blood cells (lymphocytes) work to clean the area of debris and bacteria. This is true even in cases of acne and eczema!

2 Second Stage: PROLIFERATIVE STAGE - The proliferative stage can last up to 3 weeks. Timing can be dependent on the size and severity of wound. This is when granulation occurs. Special cells called fibroblasts make collagen to fill in the wound and create barriers. Blood vessels form to supply the new skin if needed. The wound eventually is covered by new skin.

3 Third Stage: MATURATION & REMODELING - This stage can last up to 2 years! As new collagen forms it may change the shape of the wound and increase the strength of the surrounding tissue. However, scar tissue may only be 80% as strong as the original skin. This ability to repair on this stage is diminished with age.

4 SKIN CARE STEPS TO HEALING

1. Debride and Cleanse - Clean the wound with an FDA approved cleanser with no perfumes, or additives that may irritate collagen or lymphocytes.
2. Maintain a Moist Environment - Healing skin requires and discharges bacteria and dead skin through granulation.
3. Provide Materials for healing - Proteins and water are critical for all phases of healing. Minerals such as Zinc are crucial for protein synthesis and is a key part of the thymidine molecule which enables T lymphocytes to mature.
4. Prevent injury and infection - Infection will greatly slow down healing.

Supplements of copper, Cernella, Aloe Vera, Arginine, Glutamine, Vitamin B5 and C, Bromelain and Curcumin have all been related to successful skin and wound healing.

For great results, try Epizyn Skin Topical Use code-BBCD for \$5 off.

How zinc helps skin

“

We have placed seven patients on Epizyn. Of those patients, 90% have responded positively with regard to itching, erythema, and scaling.
