

Genital Warts Can Have Dangerous Complications; CBCD Reviews the Medical Evidence

Genital wart complications may include cancer and problems during pregnancy. (1)

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, September 1, 2015 /EINPresswire.com/ --

"Infected with the human papillomavirus (HPV)? The CBCD recommends taking [Gene-Eden-VIR](#) or [Novirin](#)." - Greg Bennett, CBCD

Most people don't realize that genital warts are not the only symptom of a human papillomavirus (HPV) infection. While low-risk HPV is associated with genital warts, and high-risk HPV is associated with cancer, "some genital warts are made of skin tissue co-infected with both low and high risk HPV strains." (2) In fact, according to a study by Dr. Park and colleagues, 20.5% of all warts tested "contained both high-risk and low-risk HPV types." (2) This finding prompted Dr. Park to conclude that "genital warts with high-risk HPV types may be considered a clinical marker of risk for developing a malignant disease (cancer)." (2) Dr. Park and colleagues are from the Smile Jung's Urology Clinic in Busan, Korea.

The Mayo Clinic goes further, stating that "certain types of HPV also are associated with cancer of the vulva, cancer of the anus, cancer of the penis, and cancer of the mouth and throat. Human papillomavirus infection doesn't always lead to cancer, but it's still

important for women to have regular Pap tests, particularly if you've been infected with higher risk types of HPV." (1)

partner to the next.” (3) If a person suspects that genital warts are appearing, The Center for the Biology of Chronic Disease (CBCD) recommends that this individual set a doctor's appointment and get checked. In addition, the Center recommends taking Gene-Eden-VIR or Novirin. The formula of these natural antiviral products was shown to reduce symptoms associated with HPV infection in two separate post-marketing studies that followed FDA guidelines.

The formula of Gene-Eden-VIR and Novirin was tested by Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, “individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR.” (4) The study authors also wrote that “we observed a statistically significant decrease in the severity, duration, and frequency of symptoms.” (4)

Both products can be ordered online on the Gene-Eden-VIR and Novirin websites, here:

and

<http://www.novirin.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Once infected, if warts do show up, they will most often appear on moist surfaces. These are especially at the entrance of the vagina and rectum in women. “In men and women, they can appear anywhere in the genital or anal area. They may be small, flat, flesh-colored bumps or tiny, cauliflower-like bumps. Individual warts usually measure 1 millimeter to 2 millimeters in diameter – much smaller than the diameter of a pencil eraser – but clusters can be quite large. In some cases, warts can be so small that you can't see them. Genital warts may not cause any symptoms, or they may cause itching, burning, tenderness or pain.” (3)

HPV sometimes affects men and women differently. Brown University warns that “Most men with HPV don't have any symptoms and so diagnosing HPV in men is difficult. Since there is no treatment for asymptomatic HPV, most men are not treated. It is possible for men to think they have no symptoms when they actually do. Sometimes a medical provider can see small warts that have gone unnoticed, particularly if they are right inside the opening of the penis. Men and women should stop having sexual contact as soon as they know or think they have genital warts and they should seek treatment immediately.” (3)

Are there treatments available against the HPV?

“There are no drugs approved against the HPV. Current treatments include procedures, such as cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO2) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission.” (4) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV.

“We recommend that individuals infected with the latent HPV virus take Gene-Eden-VIR or Novirin.” - Greg Bennett, CBCD
