

HPV May Cause Cancer Following Casual Sex; CBCD Reviews Medical Evidence

A study showed that the prevalence of oncogenic HPV infection was 37% in women who went online for casual sex. (1)

ROCHESTER, NY, UNITED STATES, October 18, 2015 /EINPresswire.com/ --

“Infected with the human papillomavirus (HPV)? We recommend taking [Gene-Eden-VIR](#) or [Novirin](#).” – Greg Bennett, CBCD

A significant number of women who go to online dating websites for casual sex are infected with a cancer causing strain of the human papillomavirus (HPV). Dr. Barrere and colleagues wrote in a study that “The prevalence of oncogenic HPV infection was 37%, and 9% of women tested positive for HPV-16 or HPV-18 ... and ... in multivariate analyses, variables associated with an increased likelihood of oncogenic HPV infection included male partners in the past 6 months who were reported to have at least 1 concurrent partnership.” (1) In other words, women who slept with a man who had another sexual relationship were more likely to become infected with a cancer causing strain of HPV. Dr. Barrere is from the University of Washington in Seattle.

The Center for the Biology of Chronic Disease (CBCD) recommends that any woman who may be concerned about an HPV infection take Gene-Eden-VIR or Novirin. The formula of these natural, antiviral products was shown to reduce

symptoms associated with HPV infection in two separate post-marketing clinical studies that followed FDA guidelines. Additionally, their formula was designed to help the immune system target the latent HPV.

clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, “individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR.” (2) The study authors also wrote that “we observed a statistically significant decrease in the severity, duration, and frequency of symptoms.” (2)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites here:

<http://www.novirin.com>

and

<http://www.gene-eden-vir.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: Novirin has the same formula as Gene-Eden-VIR. However, it contains higher quality and more expensive ingredients.

It is important for the public to realize that many couples who engage in casual sex care about their health. They use condoms to help prevent sexually transmitted infections. However, most are unaware that “contrary to popular belief, condoms provide very little protection against skin-to-skin contact transmissible diseases such as HPV.” (3)

In another study, Dr. Abraham noted that “most people who have genital HPV don’t know they have it because there are often no symptoms, and it goes away on its own without causing any serious health problems. It is estimated that more than 75 per cent of women and men will have this type of infection at one point of their lives.” (3) The virus usually affects young women and men who are in their late teens and early 20s.

What Treatments are Available for HPV infections?

“There are no drugs approved against the HPV. Current treatments include procedures, such as cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO2) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission.” (2) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV, and were shown to reduce HPV symptoms in two separate post-marketing clinical studies that followed FDA guidelines.

The CBCD therefore recommends that HPV infected individuals take Novirin or Gene-Eden-VIR.
