

HPV: Do Only People Who Cheat Get Infected?; The CBCD Answers a Survey Question

Does the human papillomavirus usually infect only those who cheat on their significant others? The CBCD answers a question from its October 2015 survey.

ROCHESTER, NY, UNITED STATES, November 8, 2015 /EINPresswire.com/ --

“Infected with the human papillomavirus (HPV)? We recommend taking [Gene-Eden-VIR](#) or [Novirin](#).” – Greg Bennett, CBCD

The Center for the Biology of Chronic Disease (CBCD)'s October 2015 survey found that 55% of participants had the false belief that HPV infection is associated with infidelity (cheating) in a relationship. The reality, however, is that this false belief “has led many people to tragically wrong conclusions because it fails to take into account one of the most mysterious aspects of genital HPV: its ability to lie latent. The virus can remain in the body for weeks, years, or even a lifetime, giving no sign of its presence. Or a genital HPV infection may produce warts, lesions, or cervical abnormalities after a latent period of months or even years.” (1) In other words, an individual may have been completely faithful to their partner, and still may develop symptoms associated with an HPV infection.

The Center for the Biology of Chronic Disease (CBCD) therefore recommends that anyone who may be concerned about an HPV infection take Gene-Eden-VIR or Novirin. The formula of these natural, antiviral products was shown to reduce symptoms associated with HPV infection in two separate post-marketing clinical studies that followed FDA guidelines. It was designed to help the immune system target the latent HPV.

Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, “individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR.” (2) The study authors also wrote that “we observed a statistically significant decrease in the severity, duration, and frequency of symptoms.” (2)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites here:

<http://www.novirin.com>

and

<http://www.gene-eden-vir.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: Novirin has the same formula as Gene-Eden-VIR. However, it contains higher quality and more expensive ingredients.

“Most people who are infected with genital HPV never know it; their virus does not call attention to itself in any way. In most cases, a person is diagnosed with HPV only because some troubling symptom drove him or her to a health care professional, or some abnormality was revealed in the course of a routine exam.” (1)

What Current Treatments are Available for HPV infections?

“There are no drugs approved against the HPV. Current treatments include procedures, such as cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO2) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission.” (2) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV, and were shown to reduce HPV symptoms in two separate post-marketing clinical studies that followed FDA guidelines.

The CBCD therefore recommends that HPV infected individuals take Novirin or Gene-Eden-VIR.
