

HPV: What is the Average Size of Genital Warts?; The CBCD Answers a Survey Question

The human papillomavirus (HPV) can cause rapidly growing external genital warts. (1)

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, December 11, 2015 /EINPresswire.com/ --

“Infected with the human papillomavirus (HPV)? We recommend taking [Gene-Eden-VIR](#) or [Novirin](#).” – Greg Bennett, CBCD

The Center for the Biology of Chronic Disease (CBCD)'s November 2015 survey found that many participants infected with the human papillomavirus (HPV) were concerned about how large their genital warts might grow to be. According to the Merck Manual, “Genital warts grow rapidly and sometimes cause burning pain.” (1) Although their size “differs between patients and ... some people will only have one or two warts while others may develop a large number of individual growths ... (2), “ndividual warts usually measure 1 millimeter to 2 millimeters in diameter.” (3)

It's important to note that HPV is the most common sexually transmitted infection (STI). “You can catch HPV simply through skin-to-skin contact with the genital area of an infected person during an intimate encounter. Skin-to-skin contact can be as simple as rubbing the penis against the opening of the vagina or anus, or kissing the genitals. You do not need to have sex, whether it's oral, vaginal, or anal, to spread the infection.” (4) In other words, a person's skin only needs to come into contact with an infected person's skin, and the virus may be transmitted.

The Center for the Biology of Chronic Disease (CBCD) therefore recommends that anyone who may be concerned about an HPV infection, which can cause genital warts and

of these natural, antiviral products was shown to reduce symptoms associated with HPV infection in two separate post-marketing clinical studies that followed FDA guidelines. Additionally, it was designed to help the immune system target the latent HPV.

The formula of these natural antiviral products was tested by Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, "individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR." (5) The study authors also wrote that "we observed a statistically significant decrease in the severity, duration, and frequency of symptoms." (5)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites here:

<http://www.novirin.com>

and

<http://www.gene-eden-vir.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: Novirin has the same formula as Gene-Eden-VIR. However, it contains higher quality and more expensive ingredients.

"Most people who are infected with genital HPV never know it; their virus does not call attention to itself in any way. In most cases, a person is diagnosed with HPV only because some troubling symptom drove him or her to a health care professional, or some abnormality was revealed in the course of a routine exam." (4) Additionally, immunize.org notes that "For people who are sexually active, a long-term, mutually monogamous relationship with an uninfected partner is the strategy most likely to prevent future genital HPV infections. However, it is difficult to determine whether a partner who has been sexually active with another partner in the past is currently infected." (6)

What Current Treatments are Available for HPV infections?

"There are no drugs approved against the HPV. Current treatments include procedures, such as cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO2) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission." (5) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV, and were shown to reduce HPV symptoms in two separate post-marketing clinical studies that followed FDA guidelines.

The CBCD therefore recommends that HPV infected individuals take Novirin or Gene-Eden-VIR.
