

Is Herpes Just One Virus?; The CBCD Answers a Survey Question

The answer is “no.” There are at least nine different viruses in the herpes family that cause disease. (1)

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, December 20, 2015 /EINPresswire.com/ --

“Infected with the herpes virus (HSV-1 or HSV-2)? The CBCD recommends taking [Gene-Eden-VIR](#) or [Novirin](#).” - Greg Bennett, CBCD

The Center for the Biology of Chronic Disease (CBCD)’s November 2015 survey found that 88% of participants did not know that there are at least nine herpes viruses that cause disease. Many people are only familiar with two of them that cause symptoms, such as painful mouth or genital sores that people commonly associate with the name, “Herpes.” These two viruses are HSV-1 and HSV-2. “Both types can cause symptoms on the genitals (genital herpes), the face (facial cold sores), or the hand or finger (called a herpetic whitlow).” (1)

There are seven other viruses in the herpes family, however, that cause disease. The public should be aware, therefore, that all herpes viruses belong to one of three groups (sub-types in the herpes family of viruses). These viruses “belong to the following three families:

- Alpha-herpesviruses: HSV 1 and 2; VZV - these have a relatively short reproductive cycle, variable host range, efficiently destroy infected cells and establish latent infections primarily in sensory ganglia.
- Beta-herpesviruses: CMV, HHV-6 and HHV-7 - these have long reproductive cycles and a restricted host range. Infected cells often enlarge. Latency can be maintained in the white cells of the blood, kidneys, secretory glands and other tissues.

- Gamma-herpesviruses: EBV and HHV-8 - these are specific for either T or B lymphocytes, and latency is often demonstrated in lymphoid tissue.” (2)

When an individual experiences symptoms, depending on the strain of herpes with which he or she is infected, that person can develop cold sores or genital herpes. The CDC notes that when a genital herpes virus causes symptoms, an individual usually experiences “one or more blisters on or around the genitals, rectum or mouth. The blisters break and leave painful sores that may take weeks to heal. These symptoms are sometimes called “having an outbreak.” The first time someone has an outbreak they may also have flu-like symptoms such as fever, body aches, or swollen glands. Repeat outbreaks of genital herpes are common, especially during the first year after infection. Repeat outbreaks are usually shorter and less severe than the first outbreak.” (3)

However, besides HSV-1 and HSV-2, there are seven other viruses in the herpes family. These viruses include: the “Varicella-zoster virus (also called herpes zoster). This causes chickenpox and shingles which are occasionally mistaken for herpes simplex. Shingles is a recurrence of chickenpox and in the elderly it may cause painful nerve damage. Cytomegalovirus (CMV) and Epstein Barr virus, also called glandular fever. These viruses do not cause spots or blisters like herpes simplex. They may cause flu-like illnesses. And four others: human herpes viruses 6, 6a, 7 and 8.” (1)

The Center for the Biology of Chronic Disease (CBCD) recommends that anyone diagnosed with a herpes virus take Gene-Eden-VIR or Novirin. The formula of these natural antiviral products was shown to reduce symptoms associated with herpes viruses in two separate post-marketing clinical studies that followed FDA guidelines. Additionally, it was designed to help the immune system target the latent form of these viruses.

The formula of Gene-Eden-VIR and Novirin was tested by Hanan Polansky and Edan Itzkovitz from the CBCD. The studies showed that the Gene-Eden-VIR and Novirin formula is effective against the family of herpes viruses, including HSV-1 and HSV-2. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, “individuals infected with (a herpes virus)...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR.” (4) The study authors also wrote that, “We observed a statistically significant decrease in the severity, duration, and frequency of symptoms.” (4)

Both products can be ordered online on the Gene-Eden-VIR and Novirin websites, here:

<http://www.gene-eden-vir.com>

and

<http://www.novirin.com>

Gene-Eden-VIR and Novirin are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinensis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Gene-Eden-VIR and Novirin are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: Novirin shares the same formula as Gene-Eden-VIR. The difference between the two is that Novirin has higher quality and more expensive ingredients.

The CBCD reminds the public that Gene-Eden-VIR and Novirin are not a cure for infections with a herpes virus. However, two clinical studies, published in peer reviewed medical journals showed that their formula decreases symptoms in infected individuals. Specifically, the formula of Gene-Eden-VIR and Novirin was shown to safely and effectively reduce symptoms associated with herpes viruses. Additionally, it was designed to help the immune system target these latent viruses.

“We recommend that individuals who are infected with a latent herpes virus, take Gene-Eden-VIR or Novirin.” – Greg Bennett, CBCD
