

HPV: What are Anal Warts?; The CBCD Answers a Survey Question

Anal warts (also called "condyloma acuminata") are growths found in the area around and inside the anus. (1)

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, December 20, 2015 /EINPresswire.com/ --

"Infected with the human papillomavirus (HPV)? We recommend taking [Gene-Eden-VIR](#) or [Novirin](#)." - Greg Bennett, CBCD

The Center for the Biology of Chronic Disease (CBCD)'s November 2015 survey found that 84% of participants did not understand that "genital warts" refers to warts on the genitals as well as the buttocks and anus. Anal warts "first appear as tiny spots or growths, perhaps as small as the head of a pin, and may grow quite large and cover the entire anal area. They usually appear as a flesh or brownish color. Usually, they do not cause pain or discomfort and patients may be unaware that the warts are present. Some patients will experience symptoms such as itching, bleeding, mucus discharge and/or a feeling of a lump or mass in the anal area." (1)

According to the American Society of Colon and Rectal Surgeons (ASCRS), anal warts are "caused by the human papilloma virus (HPV), which is transmitted from person to person by direct contact. HPV is considered to be

the most common sexually transmitted disease (STD). You may be upset when you are given this diagnosis and it is important to note that anal intercourse is not necessary to develop anal condylomata. Any contact exposure to the anal area (hand contact, secretions from a sexual partner) can result in HPV infection. Exposure to the virus could have occurred many years ago or from prior sexual partners, but you may have just recently developed the

therefore recommends individuals who may be concerned about an anal HPV infection, which can cause anal warts and other symptoms, take Gene-Eden-VIR or Novirin. The formula of these natural, antiviral products was shown to reduce symptoms associated with HPV infection in two separate post-marketing clinical studies that followed FDA guidelines. Additionally, it was designed to help the immune system target the latent HPV.

The formula of these natural antiviral products was tested by Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, "individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR." (2) The study authors also wrote that "we observed a statistically significant decrease in the severity, duration, and frequency of symptoms." (2)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites here:

<http://www.novirin.com>

and

<http://www.gene-eden-vir.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses. To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: Novirin has the same formula as Gene-Eden-VIR. However, it contains higher quality and more expensive ingredients.

It is important for the public to understand that "the safest way to protect yourself from getting exposed to HPV or any other STD, is to use safe sex techniques. Abstain from sexual contact with individuals who have anal (or genital) warts. Since many individuals may be unaware that they suffer from this condition, sexual abstinence, condom protection or limiting sexual contact to a single partner will reduce the contagious virus that causes warts. However, using condoms whenever having any kind of intercourse may reduce, but not completely eliminate, the risk of HPV infection, as HPV is spread by skin-to-skin contact and can live in areas not covered by a condom." (1)

What Current Treatments are Available for HPV infections?

"There are no drugs approved against the HPV. Current treatments include procedures, such as cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO2) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission." (2) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV, and were shown to reduce HPV symptoms in two

separate post-marketing clinical studies that followed FDA guidelines.

The CBCD therefore recommends that individuals infected with the latent HPV take Novirin or Gene-Eden-VIR.
