

# HPV: Does the Virus Infect Both Men and Women?; The CBCD Reviews a Report

*The answer is yes. Nearly all sexually active people get HPV at some point in their lives. (1)*

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, January 21, 2016 /EINPresswire.com/ --

"Infected with the human papillomavirus (HPV)? We recommend taking [Gene-Eden-VIR](#) or [Novirin](#)." – Greg Bennett, CBCD

A recent report states that men and women face the same risk of infection when it comes to HPV. However, many people do not realize that infection with the human papillomavirus (HPV) is just as common for men as it is for women. Until recently, most awareness campaigns have focused on alerting women to the risks of HPV infection because certain strains can lead to cervical cancer. Today there are vaccines that help prevent infection with the most common strains. More than this though, men were ignored because "most men infected with HPV never develop symptoms, and it goes away on its own. However, if HPV doesn't go away, it can cause genital warts or some types of cancer. The penis or anus is where genital warts usually appear. They can be single or groups of cauliflower-shaped bumps that are large, small, flat or raised. The warts may go away, remain the same, or grow in number or size. Unfortunately, genital warts can return, even after treatment." (1)

The truth is, HPV can cause cancer in men just as it can in women. "HPV infection can cause penile, anal and oropharyngeal cancer. Cancer develops very slowly and diagnosis may not happen for years or decades after the initial infection by HPV, the CDC says." (1)

concerned about a latent HPV infection take Gene-Eden-VIR or Novirin. The formula of these natural, antiviral products was shown to reduce symptoms associated with HPV infection in two separate post-marketing clinical studies that followed FDA guidelines. It was designed to help the immune system target the latent HPV.

The formula of these natural antiviral products was tested by Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal *Pharmacology & Pharmacy*, the first, in a special edition on *Advances in Antiviral Drugs*. Study authors wrote that, “individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR.” (2) The study authors also wrote that “we observed a statistically significant decrease in the severity, duration, and frequency of symptoms.” (2)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites here:

<http://www.novirin.com>

and

<http://www.gene-eden-vir.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses.

To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: Novirin has the same formula as Gene-Eden-VIR. However, it contains higher quality and more expensive ingredients.

“About 80 of women will get HPV at some point. Many do not know they have it, because - as with men - symptoms are rare and HPV usually disappears on its own. When it doesn’t, women run the risk of developing genital warts and certain types of cancer.” (1)

### What Treatments are Available for HPV infections?

“There are no drugs approved against the HPV. Current treatments include procedures, such as cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO<sub>2</sub>) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission.” (2) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV, and were shown to reduce HPV symptoms in two separate post-marketing clinical studies that followed FDA guidelines.

The CBCD therefore recommends that HPV infected individuals take Novirin or Gene-Eden-VIR.
