

## Co-infection with HPV and EBV Linked to Cancer Development; The CBCD Reviews a Study

The co-infection of EBV and HPV plays an important role in the initiation of a neoplastic transformation of carcinogenesis. (1)

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, January 27, 2016 /EINPresswire.com/ --

"Infected with the human papillomavirus (HPV)? The CBCD recommends taking Gene-Eden-VIR or Novirin." - Greg Bennett, CBCD

Research shows that the human papillomavirus (HPV) and the Epstein-Barr Virus (EBV) are linked individually to the development of certain cancers. For example, HPV is well-known for its link to cervical cancer. Likewise, EBV is wellknown for its link to the development of a diverse group of lymphomas and carcinomas. Together, the viruses may play a role individually and collectively in causing cancer. For example, Dr. Shi and colleagues wrote that "many studies have found that HPV infection is linked to NPC (nasopharyngeal carcinoma, nose and throat cancer) as an etiologic factor and that EBV is also present in cervical cancer and prostate cancer. The coexistence of both EBV and HPV has also been reported in other epithelial cancers, such as breast cancer." (1)

Another example of co-infection and cancer development "is well known that

there is a strong association between high-risk HPVs and cervical cancer. Because it takes a long time for patients from being infected by HPV to developing cervical cancer, HPV is found in nearly 100% of cervical carcinoma cases; however, most women infected do not develop the disease,

individuals will be infected with one of them, or both, by the time they reach adulthood. The Center for the Biology of Chronic Disease (CBCD) recommends that people who are concerned about infection with the latent HPV or latent EBV take Gene-Eden-VIR or Novirin. The formula of these natural antiviral products was designed to help the immune system target these latent viruses. Moreover, it was shown to reduce HPV and EBV symptoms in two separate post-marketing clinical studies that followed FDA guidelines.

"No one wants to develop cancer, which could be the result of an HPV or EBV infection. We recommend targeting the latent form of the HPV and EBV viruses with Gene-Eden-VIR or Novirin." - Greg Bennett, CBCD

The formula of Novirin and Gene-Eden-VIR was tested by Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, "individuals infected with the HPV (and EBV)...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR." (2) The study authors also wrote that "we observed a statistically significant decrease in the severity, duration, and frequency of symptoms." (2)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites, here:

http://www.gene-eden-vir.com

and

## http://www.novirin.com

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses.

To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims. Note: Novirin has the same formula as Gene-Eden-VIR. However, it contains higher quality and more expensive ingredients.
