JAR Adds Uptime Monitoring with Functionality testing to its Load Testing Platform

JAR Technologies announces the release of its new Smart Uptime Monitoring Tool, JAR: Monitor.

BELFAST, NORTHERN IRELAND, February 23, 2016 /EINPresswire.com/ -- The solution is a ground breaking website uptime monitoring and functionality testing tool. It joins our existing cloud based web load-testing tool, JAR: Load, providing multiple options for businesses to integrate powerful load and performance testing.

Smart Uptime Monitoring JAR Technologies

JAR: Monitor, a smart 24/7 Uptime monitoring tool, also lets you analyse the functionality of your website. This is of critical importance in the real world of transaction intensive websites. JAR: Monitor is designed to analyse even the most complex website 24x7, including all the hidden interactions between databases, webservers, third party software and load balancing systems. Testing frequency can be anything from 'per minute' upwards – delivering true 24/7 feedback. JAR Technologies understand that modern software systems are dynamic and unexpected events can occur at any time, resulting in solution performance degradation.

JAR: Monitor integrates closely with JAR: Load – taking all of the powerful capabilities it delivers and adding 24/7 monitoring to the mix. The two offerings combine to deliver unrivalled load and performance testing with continuous monitoring – all based on real browsers and real user interactions.

"JAR: Monitor is built on the foundation of our cloud based load testing solution JAR: Load, the complete tool for performance testing," stated James Hunter, CEO of JAR Technologies. "The tool can provide value to any website owner who wants to deliver a world-class user experience. JAR: Monitor enables users to check real delivery, not just whether the site is 'up' or not. Yet again we are delivering another cost-effective solution that will reduce your time and effort while increasing customer satisfaction and revenue."
