

## HPV in the Gums May Contribute to Mouth Cancer; The CBCD Examines the Medical Evidence

Presence of high risk human papillomaviruses in periodontal pockets could link periodontitis to HPV related squamous cell carcinoma. (1)

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, May 9, 2016 /EINPresswire.com/ --

"Infected with the human papillomavirus (HPV)? The CBCD recommends taking Gene-Eden-VIR or Novirin." - Greg Bennett, CBCD

High risk human papillomavirus strains (cancer causing HPV) have been found in the gums of people with periodontal disease. Dr. Dayakar and colleagues wrote that "high risk human papillomaviruses have been detected in the periodontium of patients diagnosed with chronic periodontitis as well as those with healthy gingiva. It has even been thought that sites in close proximity to tongue and oropharynx may serve as reservoirs for high risk human papillomaviruses." (1) Dr. Dayakar is from the Department of Periodontics, K.V.G Dental College in Karnataka, India. The American Academy of Periodontology notes that "Your bone and gum tissue should fit snugly around your teeth like a turtleneck around your neck. When you have periodontal disease, this supporting tissue and bone is destroyed, forming "pockets" around the teeth. Over time, these pockets become deeper, providing a larger space for bacteria (and viruses) to live." (2)

Hanan Polansky and Edan Itzkovitz from the CBCD in two clinical studies that followed FDA guidelines. The studies showed that the Novirin and Gene-Eden-VIR formula is effective against the HPV and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, "individuals infected with the HPV...reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR." (3) The study authors also wrote that "we observed a statistically significant decrease in the severity, duration, and frequency of symptoms." (3)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites, here:

http://www.gene-eden-vir.com

and

## http://www.novirin.com

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses.

To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

What Causes Oral HPV Infection?

Three main causes of oral HPV infection are sexual activity, self-infection, and sharing oral products. (4) In fact, Dr. Percinoto and colleagues wrote that abnormal growths in the mouth are a "sexually transmitted disease (STD) appearing most frequently as soft, pink cauliflower like growths in moist areas, such as the genitalia, mouth and other places. The disease is highly contagious, (and) can appear singly or in groups, small or large." (5) Dr. Percinoto and colleagues are from the Aracatuba Dental School at the University of Estadual Paulista in Brazil. "Both sexes are affected equally, and the infection is usually transmitted by sexual intercourse." (5)

Additionally, the CDC notes that "some studies suggest that oral HPV may be passed on during oral sex (from mouth-to-genital or mouth-to-anus contact) or open-mouthed ("French") kissing, others have not. The likelihood of getting HPV from kissing or having oral sex with someone who has HPV is not known. We do know that partners who have been together a long time tend to share genital HPV-meaning they both may have it." (6) Moreover, the CDC says that "there is no FDA-approved test to diagnose HPV in the mouth or throat. Medical and dental organizations do not recommend screening for oral HPV." (6) Thus, there is no way to know for sure if a person has an oral HPV infection unless the person develops HPV abnormal growths in the mouth.

Are there treatments available against the HPV?

"There are no drugs approved against the HPV. Current treatments include procedures, such as cryotherapy, conization, and the Loop Electrosurgical Excision Procedure (LEEP). These procedures use liquid nitrogen, a surgical knife (scalpel), a carbon dioxide (CO2) laser, or electrical current to remove the abnormal growths caused by the HPV. These growths include cells that harbor the active

virus. The procedures do not target cells with the latent virus. Since they do not remove the latent virus, these procedures only produce a temporary remission." (3) In contrast, Novirin and Gene-Eden-VIR were designed to target the latent HPV.

"We recommend that individuals infected with the latent HPV virus take Novirin or Gene-Eden-VIR" - Greg Bennett, CBCD
