

Herpes Dating Sites: Increasing the Stigma?; The CBCD Reviews a Report

A report suggested that HSV dating sites seemed less likely to unite people with STIs than to divide them into cliques. (1)

ROCHESTER, NEW YORK, UNITED STATES OF AMERICA, May 23, 2016 /EINPresswire.com/ --

“Infected with the herpes simplex virus (HSV-1 or HSV-2)? The CBCD recommends taking [Gene-Eden-VIR](#) or [Novirin](#) against the latent virus.” – Greg Bennett, CBCD

Using a herpes dating site may not be as effective as regular sites when trying to find true love, according to a report on Motherboard. As Motherboard noted, “There’s no question that these sites (which have even spawned their own Tinder-like apps) are a fantastic demonstration of how innovative online dating platforms can be. But even as they bring together a number of people living with STIs, they don’t seem to do much to improve general education about living with herpes and other STIs. And as a result, people going online in search of connection and support often end up feeling stigmatized, isolated, and more alone than ever.” (1)

Dr. Foster and colleagues wrote that the more people experience the stigma, the more unhappy they feel. (2) Dr. Foster is from the University of New Brunswick in Canada. The American Sexual Health Association notes that “while the emotional issues that accompany a diagnosis should be addressed, it is important not to overstate them nor assume everyone will respond in the same manner. While some people are shocked, ‘angry,’ and ‘upset,’ by an initial diagnosis ... not everyone is angry and miserable ... once a person has been educated about the virus, and has lived with the infection for some time, they’re likely to have a different emotional outlook.” (2)

“We believe that honesty, and openness about the topic of

Including this information in a dating profile, from the very beginning, may keep some people from contacting you, but it won't prevent the ones that matter." – Greg Bennett, CBCD

The Center for the Biology of Chronic Disease (CBCD) recommends that individuals living with a latent herpes infection (HSV-1 or HSV-2) take Gene-Eden-VIR or Novirin. The formula of these natural, antiviral products was shown to reduce symptoms associated with herpes infections in two separate post-marketing clinical studies that followed FDA guidelines. In addition, the formula was designed to target the latent herpes virus.

The formula of Gene-Eden-VIR and Novirin was tested by Hanan Polansky and Edan Itzkovitz from the CBCD. The studies showed that the formula is effective against the herpes simplex virus, and other viruses. The clinical studies were published in the peer reviewed, medical journal Pharmacology & Pharmacy, the first, in a special edition on Advances in Antiviral Drugs. Study authors wrote that, "individuals infected with the HSV ... reported a safe decrease in their symptoms following treatment with Gene-Eden-VIR." (3) The study authors also wrote that, "we observed a statistically significant decrease in the severity, duration, and frequency of symptoms." (3)

Both products can be ordered online on the Novirin and Gene-Eden-VIR websites, here:

<http://www.gene-eden-vir.com>

and

<http://www.novirin.com>

Novirin and Gene-Eden-VIR are natural antiviral dietary supplements. Their formula contains five natural ingredients: Selenium, Camellia Sinesis Extract, Quercetin, Cinnamomum Extract, and Licorice Extract. The first ingredient is a trace element, and the other four are plant extracts. Each ingredient and its dose was chosen through a scientific approach. Scientists at polyDNA, the company that invented and patented the formula, scanned thousands of scientific and medical papers published in various medical and scientific journals, and identified the safest and most effective natural ingredients against latent viruses.

To date, Novirin and Gene-Eden-VIR are the only natural antiviral products on the market with published clinical studies that support their claims.

Note: The formula of Novirin is the same as the formula of Gene-Eden-VIR. The difference between the two is that Novirin contains higher quality, and more expensive, ingredients.

A last bit of advice from Motherboard suggested that "treating herpes as the annoying, but manageable, infection that it is can have a huge impact with potential partners." (1)

What treatments are available for herpes infections?

"Two types of antiviral treatments against HSV are available: topical and oral. The treatments include penciclovir, acyclovir, famciclovir, and valaciclovir. However, their effectiveness is limited. For instance, a meta-analysis of five placebo-controlled and two dose comparison studies evaluated the effect of aciclovir, famciclovir or valaciclovir on symptoms. The meta-analysis showed that oral antiviral therapy decreases the duration and the associated pain of an outbreak by merely one day." (3) There are also the natural supplements Novirin and Gene-Eden-VIR, which have a formula that was designed to help

the immune system target the herpes virus when it is in a latent form.
