The new modern technology has changed the way production process happens in factories these days. These days the mechanical devices can be coupled to computers and can be fed precise information to do what work to do and how to do. This has led to the development of automated equipment which can produce much more than the conventional machines. The efficiency and the reliability of these products is also high. With the demand for products in the market increasing, production deadlines have become harder to meet hence the use of automated equipment in the factories has increased.

The smooth integration of hardware and software has enabled factories to reduce wastage, lesser accidents, robust and accurate products in an economically profitable way. The systems also can be monitored in a better way and they have very few errors in the manufacturing processes. Wireless technology also has helped in increasing the usage of automation in factories. Remote terminal units enable control of machines over the entire shop floor thereby increasing ease of use and thereby reducing human controller exposure to hazardous areas. Advanced technology in sensors has helped in smart manufacturing. This provides increased efficiency with reduced human intervention.

The report analyses the strategies and developments employed by the major players in the market like ABB, General Electric, Siemens, etc. and offers a comprehensive overview of the market.
