PUNE, MAHARASHTRA, INDIA, August 1, 2016 /EINPresswire.com/ -- China, India, US & Europe (Global) Potash Ores Market: Overview Potash ores are the foremost raw materials which are mostly used to produce the compound fertilizers, potash and other different chemicals. The need for agriculture fertilizers is gradually rising which resulted in increase in demand for potash ores due to constraining factors such as rising global population, growing labor shortage and rural wages. The potash ore generally comprises of potassium chloride (sylvite), sodium chloride (halite), anhydrite, carbonate and silicate. The processing of potash ore is mainly done by hot leaching with further and advance crystallization of potash salt from the inundated or saturated salt brines. While preparing of potash ore, the two different primary methods are implemented. The first one is flotation i.e. mechanical method and hot leaching i.e. chemical method. Many of the manufacturers use both the methods. The flotation method is generally based on the different capacity of halite and sylvite surface to be moisturized with water through the addition of exclusively acting chemicals. The method of hot leaching i.e. chemical method is based on the physicochemical properties of water, sodium chloride and potassium chloride.
