The analysts forecast the [global transplant diagnostics market](#) to grow at a CAGR of 6.63% during the period 2016-2020.

Transplantation involves the transfer of cells, tissues, or organs from a donor to a recipient for restoring their function in cases of damage. Donor and recipient cells, tissues, and organs should match or be compatible, otherwise it can lead to transplant rejection. Human leukocyte antigens (HLAs) are present on the surface of the cells that regulate body recognition and reject foreign tissue transplants. In humans, major histocompatibility complex controlled by the genes located on chromosome 6 is responsible for ensuring compatibility between donors and recipients.
