The analysts forecast the Global [Risk Analytics](#) Market to grow at a CAGR of 13.95 percent over the period 2014-2019.

Risk analytics is defined as an effective tool to control risk and use various assumption, risk prevention, and risk retention for managing uncertain events. Risk can be financial as well as operational or strategic in nature. Risk analytics started when financial organizations started realising the loss of their information and capital and thus started developing models and formulas to hedge against unforeseen risk and reduce regulatory capital. The risk analytics process includes the risk identification, priority segmentation, and use of internal and external data to measure the risk, information collection, and take the appropriate measures to minimise risk. Also by analysing historical risk patterns, future risks can be predicted and necessary actions and business decisions can be taken. Organizations develop risk models to optimize and mitigate risk which can negatively affect organization's product or services.
