PUNE, INDIA, January 9, 2017 /EINPresswire.com/ -- [APAC Hydraulic Fracturing Market](#)

Hydraulic fracturing or hydraulic fracking is a technique of well stimulation in which a fluid, at a high pressure (typically water mixed with sand and chemicals), is injected into an oil well to create minor fractures in the deep rock foundations to facilitate the movement of natural gas, petroleum, and brine from deep reserves to the well. The technique of fracturing is common for shale gas and oil recovery wells. Usually, this type of stimulation is carried out once during the productive life of the well and increases the productivity of the well.
