DALLAS, TX, UNITED STATES, February 16, 2017

/EINPresswire.com/ -- [E-passports and E-visas](#) are used to authenticate a traveller's identity when crossing borders or entering into another country. This technology stores data about the traveller on a smart chip, which includes a unique identification number and a digital signature. It is more secure than traditional paper technology as it prevents data alteration and duplication. The data stored electronically on the chip is authenticated by PKI, thus making e-passport forgeries impossible. Facial, fingerprint, and iris recognition are major biometric modalities used for this process.
