[Global Client Solid-State Drive \(SSD\) Market](#)

Description

An SSD is a solid-state disk or an electronic disk that is used for data storage and is built out of semiconductors. It uses the same I/O interface design as HDDs and stores data in solid state memory. They are made of silicon microchips and stores data electronically. These devices use dynamic random-access memory (DRAM) or negative-AND (NAND)-based flash memory to store data. The lack of moving parts reduces the risk of mechanical failures of SSDs allowing data transfer at higher speeds. In addition, they are suited for harsh environments, extreme shock, high altitude, and consume less power.
