[Global SOFC Market](#)

Description

An SOFC is a device that generates electricity through an electrochemical process that involves oxidation of the electrolyte when placed between the two electrodes - anode and cathode. Fuel cells are generally categorized based on the type of electrolyte material used in them; an SOFC uses a solid oxide or ceramic electrolyte. Some of the advantages of an SOFC include its low cost, low emissions, long-term stability, high efficiency, and fuel flexibility. Its high fuel flexibility permits the use of cheap, safe, and readily available fuels such as hydrocarbons, natural gas, hydrogen, methanol, and syngas. An SOFC, however, requires a high operating temperature, usually within the range of 932 degrees to 1,832 degrees Fahrenheit, for the activation of the ceramics. This high operating temperature leads to mechanical and chemical compatibility issues and longer start-up times.
