

Apeiron Data Systems Announces Major Food & Drug Administration (FDA) Storage Contract

Apeiron to provide ultra high density and performance systems for electronic discovery environments

FOLSOM, CA, USA, August 29, 2017

[/EINPresswire.com/](http://EINPresswire.com/) -- Apeiron Data

Systems announced today that it has

been awarded the federal contract to

provide data storage and compute

infrastructure to the FDA's electronic

discovery environments. Apeiron

proposed the all NVMe [ADS1000](#) with

switching and compute fully integrated in a single environment. Each system is capable of 18M IOPS

per 2U enclosure, and 72GB/s of throughput (limitation of the NAND drives). In addition to the

performance and scale advantages of NVMe, Apeiron provides 32-40GbE ports integrated in each

enclosure. The need to procure, deploy and manage external storage switching is gone with the

ADS1000. This integration of NVMe and switching saves the

FDA significant dollars on both the initial procurement and

future maintenance/management.

“

Apeiron's ADS1000 provides

the low latency native NVMe

networking necessary to truly

leverage the NVMe standard,

this includes the ability to

"pool" Intel Optane”

Jim Steed

Apeiron's VP of N. America Sales, Jim Steed says: “Aside

from all of the 'standard' storage and compute capabilities,

Apeiron provides the FDA with significant consolidation while

delivering the high performance ingest and query capabilities

these environments demand. The current and future NVMe

drive capabilities are were critical to this decision as well.

Because Apeiron can address any NVMe SSD, from any

supplier the FDA can now choose the proper drive for the particular workload. This translates to

consolidation of both compute and storage, which of course means a lower Total Cost of Ownership.”

Apeiron's ADS1000 provides a native NVMe over Ethernet storage network. Storage management is

moved to the application servers instead of an embedded/proprietary controller. This results in the

elimination of the #1 bottleneck to server and storage performance-the storage controller. With the

ability to provide 184 TB per 2U enclosure (going to 360 TB in September 2017), the ADS1000 simply

cannot be matched in the categories of both density and performance.
