

Crew Continuity the ultimate goal of crew planning - Five Top Tips from Dynama

Donald Anderson, senior advisor at Dynama gives his five top tips on how to use technology to get the same senior officers back onboard the same vessel

LONDON, UK, September 21, 2017 /EINPresswire.com/ -- Shipping is a people business and it is no secret that there are concerns in the industry regarding a future shortage of qualified seafarers of the right standard. In fact in 2015 the BIMCO/International Chamber of Shipping Manpower report identified a shortfall of approximately 16,500 officers (2.1%) with a staggering need for an additional 147,000 officers by 2025 to service the world's merchant fleet.

In a world where crew continuity and getting the same senior officers back onboard the same vessel is the ultimate goal of crew planners the task has just become much harder. Fewer crew changes mean reduced costs and a greater commitment to teamwork and collaboration at all levels. To achieve this and to overcome the challenge of seafarer shortages some ship managers are building a pool of officers to maintain continuity on vessels. However, to ensure officers are in the right place at the right time and the correct balance between officers, agency personnel and ratings is maintained, modern integrated systems are required. Those companies that adopt the latest workforce optimization solutions will be the first to see the benefits of increased consistency and efficient crewing.

Here are five top tips how to use technology to ensure crew continuity to cut costs, improve efficiency and maintain compliance:

1) Maintain an officer matrix – a digital officer matrix helps to determine which senior crew members should work together to provide the relevant levels of experience to pilot a vessel. By implementing a software-as-a-service solution ship owners and manning agents can securely access data online to ensure safety and efficiency, wherever they are located.

2) Look into the future – a modern workforce and resource optimization solution should be able to analyze current resource competences and model for future requirements. Using timeline management capabilities the system should have the ability to forecast demand across key business areas and extend planning horizons. Being prepared goes a long way to ensure that STCW compliance and IMO regulatory requirements are met.

3) Take a global view – the same report that identified the need for an additional 147,000 officers by 2025 stated that the Philippines and Russia are an important source of senior crew, followed closely by Ukraine and India. While China is thought to have overtaken the Philippines as the largest single source of seafarers qualified for international trade, data from international shipping companies suggests that available seafarers for global service may be limited. A global view of crew optimization and resourcing is essential for management to make timely decisions leading to continuity and cost savings.

4) Keep things shipshape on-and-offshore – utilize one central solution to integrate workforce scheduling and management with HR and project management systems shipside and shore-side to

provide an accurate picture of crew movements, staff and contractors, at any time. The master of the vessel can see who is scheduled to join the ship, their details and next of kin, arrival and departure dates, port visits, agents, cash and crew accounts, vessel certificates and provisions. All the information can be communicated back to shore-side to be downloaded in common formats such as Microsoft Excel and CSV files.

5) Don't delay – with the cost of crewing typically being the biggest expense when it comes to running a vessel the more continuity with crewing, in particular in terms of officers, the more costs can be controlled to make organizations competitive in an exceptionally margin sensitive market. While shipping has begun to use technology to improve vessel and crew performance, the sector still has to fully embrace technology for continuity and resource optimization.

Managing crewing by spreadsheets and pin-boards is definitely a thing of the past. Modern cloud-based solutions which remove duplicated effort, administration burdens and staff costs are the way forward for effective crew continuity and increased profitability.
