

Wondershare Data Recovery for Mac Rolls out NEW Version Adapted to the Upcoming macOS High Sierra 10.13

With the release of macOS High Sierra 10.13, Wondershare Data Recovery has also made a vital upgrade.

VANCOUVER, CANADA, September 29, 2017 /EINPresswire.com/ -- With the release of [macOS High Sierra 10.13](#), Wondershare [Data Recovery](#) has also made a vital upgrade. The advanced version of the tool is now compatible with High Sierra 10.13. It supports the new Apple File System (APFS) and can readily be used to recover lost or deleted content on Mac.

Wondershare Data Recovery tool is one of the oldest and most trusted recovery applications for Mac and Windows. It provides cost-effective data recovery solutions for the device's internal storage, hard drives, memory cards, mobile phones, camera, and more. The tool can also be used on numerous occasions to recover deleted files of different formats. It doesn't matter if the Mac has been corrupted, formatted, or has been attacked by a malware – its lost data can be retrieved by Wondershare Data Recovery software for Mac.

As stated, the upgraded Wondershare Data Recovery tool now supports macOS High Sierra as well. The new update of macOS has replaced the earlier HFS Plus file system with APFS. It stands for Apple File System and is the 64-bit technology that is designed to make the common processing of the Mac faster. For instance, the time needed to search a file or copy it is comparatively lesser in APFS than its predecessor. Additionally, it has plenty of other features like crash-safe protection, easy backup, an inbuilt encryption technique, and more.

Not only is this latest 64-bit system faster, but it is also a more secure and reliable file system. Nevertheless, it has been observed that Mac users suffer from unexpected data loss while upgrading their system to another OS. In this case, Wondershare Data Recovery tool for Mac can be an ideal solution. Since the tool supports the macOS High Sierra update, it can be used to retrieve the files

that were lost during the upgrade.

Ideally, users are recommended to take a comprehensive backup of their data before updating their system to a new OS. The new macOS High Sierra is no such exception. Even after completing the update, users are facing an unexpected loss of their data files.

The lost data from the system disk can also be recovered on macOS High Sierra by entering its Terminals. Under the “Utilities” tab, users can find the option for the Terminal. After launching it, they can provide the “csrutil disable” command and restart their system. This technique can come handy to Mac users who would like to recover their lost data.

Nevertheless, if the native solution won’t work, then users can simply take the assistance of Wondershare Data Recovery tool to retrieve the lost content on their device. With a complete support to the 64-bit APFS that is included in macOS High Sierra 10.13 update, Wondershare Data Recovery has become a complete data recovery solution for Mac users.

Before updating a Mac to the new High Sierra version, users can simply backup their content. In this way, even after suffering from a data loss, they can restore their content. If a user has not taken a backup of their data, then they can take the assistance of Wondershare Data Recovery to restore their lost data files. The tool has a user-friendly interface and provides highly reliable results. From important documents to image files and media files to archives, the tool can retrieve all kinds of data in a hassle-free manner.
