Executive Summary

Intragastric Balloons is a medical procedure which includes inserting of uninflated balloons with the help of endoscopes and then inflate the balloons in the stomach by filling it with saline solution to decrease the available stomach volume and partially filling the stomach. Intragastric balloon procedure is used in morbid obesity cases to decrease hunger and is helpful for patients who cannot lose weight by any other means and are prone to serious health problems related to obesity. As per WHO, 39% of adult population (aged 18 years and above) were overweight in 2014, and 13% were obese. Obesity has received considerable attention as a major health hazard as it leads to adverse metabolic effects such as High Blood Pressure, Diabetes, Coronary Heart Disease and Ischemic stroke. Globally, increasing obese population as a result of changing life style and increasing cases of obesity related health issues are expected to remain the prime growth drivers for intragastric balloons during the period of study.

Geographically, North America dominated the intragastric balloons market driven by world class healthcare infrastructure with technological advanced practice, higher spending, large population with obesity and related diseases and presence of key industry players in the region. North America was followed by Europe and Asia-Pacific as second and third largest market for intragastric balloons. Asia Pacific is projected to have the fastest growth, owing to rapidly developing medical infrastructure, increasing spending on healthcare and growing medical tourism in developing nations such as China and India in this region.
