"Pulse oximetry is a non-invasive method used to measure the arterial oxygen saturation level in patient's blood. Pulse oximetry works on the principle of spectrophotometry.

Pulse oximeters consist of light emitting devices
Pulse oximeters consist of a probe having light emitters with two different types of wavelengths of light, infrared and red. The light is transmitted through the body part such as a finger or ear lobe. The oxygenated hemoglobin absorbs more of the infrared light and the deoxygenated hemoglobin absorbs more of the red light. By calculating the amount of absorption, the sensor computes the proportion of oxygenated Hemoglobin in the blood, and it is displayed digitally."
