Description

WiseGuyReports.Com adds" Global Smart Card Market in the Government Sector 2015-2019 "Research To Its Database.

Smart card is a pocket-sized card, generally made of plastic, which is embedded with integrated circuits or microchips. It is used for authentication, identification, data storage, and application processing. Smart cards are classified into two types: contact-based and contactless. Contact-based smart cards have a contact area of approximately 1 square cm. These cards are inserted into the smart card reader. Contactless smart cards are embedded with integrated circuits that process and store data and communicate with a terminal via radio frequencies. These cards are used by employing a radio frequency between card and the reader that needs no physical insertion of the card. Therefore, contactless smart cards have faster applications and are user-friendly. Contactless smart cards are widely accepted and used by some of the major sectors such as BFSI, Government, Transportation, Healthcare, and Defense.
