About [Immunology](#)

The immune system protects the body from harmful things such as a virus, germs, and diseases like cancer. It is a network of cells, molecules: and organs present throughout the body. The immune system attacks the foreign substance that is found in the body. The body identifies and destroys the abnormal cells including cancerous cells. The inherent self-defense system comprises cells, which help the body in the identification of foreign molecules. Different pathways regulate various immune cells for distinguishing body's healthy cells and disease-causing foreign agents such as a virus: parasite, bacteria, fungi, and cancerous cells. To maintain the body's defense against the continuously evolving organisms, which try to attack the body in numerous ways, continuous modification of all the components of the immune system is essential.

Sometimes, the continuously modifying immune system reacts against the body's cells, considering them as foreign agents, which results in the destruction of healthy tissues and becomes the cause of autoimmune diseases and cancers. The inherent state of unresponsiveness may also be observed due to the weakened body defense owing to the genetic reasons that result in immunodeficiency disease.

Technavio's analysts forecast the global immunology market to grow at a CAGR of 4.57% during the period 2018-2022.
