

Kim Habibi To Give Crash Course On Website Building For Interested Students

SARASOTA, FLORIDA, UNITED STATES, January 26, 2018 /EINPresswire.com/ -- Every year, the advancement of website building seems to become more complicated. Services offer to make a website but coming at a high cost. The art of website building appears to be growing as a lost art. [Kim Habibi](#) hopes to change that as he plans to host a crash course on website building for students interested.

A competent web developer in 2003 would have known HTML and CSS. Now in recent years, a skilled web developer becomes well-versed in HTML and CSS, JavaScript and jQuery. Plus, responsive designs, mobile designs, and configuring websites for new devices.

While these words might be a foreign language to many, it's music to Kim Habibi's ears. He hopes to bring that same passion and clarity to students who want to learn website building.

"It's a great skill to have with today's technology," adds Habibi. "Many find website building as a hard quality to attain, but once you get the basics done, it's becoming more clear."

Website Building Looks Great On Resumes

Learning how to build websites can be a great skill to learn for future projects and sometimes lead to more work and job offers. But Habibi wants to open the possibility of one of the students turning to website building as a full-time career.

"These students will learn that web development careers are lucrative," [says Kim Habibi](#). "Demand should rise to almost 30% according to various studies. I hope they see the possibilities and take a deep look at the career."

Habibi states that having website building and coding look great on a resume. Learning a new skill signals to employers that you are resourceful, versatile, and tech-savvy. Because of learning a skill beyond the tasks of the job, it could open new opportunities within the career you never knew existed.

For instance, learning basic HTML, CSS, and JavaScript can lead to more job responsibilities. No more waiting for the tech and development team to make changes to the website. Learning these skills can you make handy when your company needs quick work done.

"Every company has a website or web portal," says Habibi. "Just because your job responsibilities do not involve web work, you can become a valuable asset to the company knowing coding and website building. The skills will impress bosses and lead to possible promotions."

Once someone learns coding, bosses and supervisors can rely on you to help manage the company's website. Also, they will depend on you to build promotional emails, navigate and debug new software. The possibilities are endless after putting in the effort to learn website building.

Website Building Makes Employees More Valuable To Team Members

Another significant effect of learning website building will be the ability to communicate effectively with technical co-workers.

"Whether your future career is marketing, human resources, or finance, you have to rely on software and development to do your job," adds Habibi. "Engineers are the ones that get these programs and coding up and running. Speaking their language can make conversations more effective."

Ultimately, Habibi hopes these students learn advanced skills in website building on their own. Before they decide on a career for college or tech schools, students should include programming. Habibi says being a full-time programmer can be a great career.

According to reports by GA and Burning Glass Technologies, there have been more than 100,000 job openings in web and mobile development within the past year.

"Mobile and websites will never go away," Habibi concludes. "The world is going more towards online development and not looking back. These students will learn that jumping into a possible career in web development could be the first step to a lengthy career with a well-paying field."

No matter which career these students decide to choose as their occupation, having website building as a skill will become valuable.
