Injectable drug delivery is defined as administration of a drug or drugs directly into patient's blood circulation through a delivery device. It is considered as the most common and effective route of administration of most therapeutic agents to achieve the desired quick response. The injectable route of drug administration is expected to continue to be an important delivery system. This has been attributed to reasons that injectable drug delivery system allows administration of drugs with poor oral bioavailability, delivery of the drug at the site of action, targeted drug delivery system. Reduction in the number of injection is achieved by various technologies such as controlled release, targeted delivery and needle free delivery thus overcoming the problems associated with conventional injectable drug delivery. This has also helped in improving quality of therapy. Injectable drug delivery has also proved beneficial in many cases such as unconsciousness, emergency conditions and nausea, due to rapid onset of action. The basic requirement for injectable drug delivery is that it should be pyrogen free, sterile and isotonic.
