Myc Proto Oncogene Protein

Overview

Myc Proto Oncogene Protein (Transcription Factor p64 or Class E Basic Helix Loop Helix Protein 39 or MYC) - Myc (c-Myc) protein encoded by Myc gene, a regulator gene that code for a transcription factor. The protein plays a role in cell cycle progression, apoptosis and cellular transformation. Myc protein is a transcription factor that activates expression of many genes through binding enhancer box sequences and recruiting histone acetyltransferases.

It also acts as a transcriptional repressor. By binding Miz-1 transcription factor and displacing the p300 co-activator, it inhibits expression of Miz-1 target genes. In addition, myc has a direct role in the control of DNA replication. Myc is a proto-oncogene and it often upregulates in many types of cancers. Myc over expression stimulates gene amplification presumably through DNA over-replication.
