A smart meter is usually an electronic device that records consumption of electric energy in intervals of an hour or less and communicates that information at least daily back to the utility for monitoring and billing. Smart meters enable two-way communication between the meter and the central system. Unlike home energy monitors, smart meters can gather data for remote reporting. Such an advanced metering infrastructure differs from traditional automatic meter reading in that it enables two-way communications with the meter.

The largest smart meter markets have been North America, Europe and eastern Asia (particularly China). And the market is supplied by a combination of large multinational firms and smaller local manufacturers.

China has become the world’s largest market for smart electricity meters as a result of several initiatives by the Chinese national government. The demand for smart meters in China is expected to grow from 62.3 million units in 2015 to 120 million units by 2021.
