Inhalers a faster and better way to deliver respiratory medication”

OMR Analyst

Inhaler are the devices which is used to deliver medication to the lungs. They can treat various respiratory problems including Asthma and Chronic obstructive pulmonary disease (COPD). A major advantage of using inhaler is that very less amount of medication is required as compared in comparison to to tablets as medicines and it goes direct to

lungs and provide relief. Another advantage of direct medication is fewer side effects and more effective treatment.

In order to deliver medication in dry powder form the DPI are used to treat respiratory diseases including The dry-powder inhaler (DPI) are used to deliver medication to the lungs in the dry powder form. It finds a significant role to treat respiratory diseases including asthma, bronchitis, emphysema and COPD. It is also used to for the along with the treatment of diabetes mellitus. They are the alternative of aerosol-based inhalers or metered-dose inhaler (MDI). They take a measured dose of powder; the medication generally comes in capsule form and is manually

loaded. These types of inhalers are generally used only by older children and adults. Generally, for a patient it is easier to use DPI as compared to MDI.

By Metered-Dose Inhaler (MDI) are used to deliver a measured amount of medication in the form of mist to the patient which can be inhaled. An MDI kit contains a pressurized canister of medication in a case along with a mouthpiece. Major advantage of metered dose inhaler are consistency and reliability. A metered dose inhaler provides same dose of medication each time. The MDI sends directly to the lungs and thus medication is able to work effectively. It is widely used to provide medication to children who can't use dry powder inhalers.

A person having a respiratory problem can be prescribed for the use of nebulizer as treatment. The nebulizer offers provides

the same types of medication as MDIs. Moreover, Nebulizers they are easier to use than MDIs specially, for children who are not mature old enough to properly use inhalers properly. They are also used by the adults with severe asthma. Nebulizer converts liquid medicine into a mist to treat asthma. They can be table top or portable and in electric or battery-run versions. A major advantage of nebulizer is that they can be used during an asthma attack as the patient doesn't need to take deep breath while using it. Additionally, multiple medications can be delivered at the same time and can be used with young children easily.

North America and Asia-Pacific are expected to be major contributors to the inhaler market whereas APAC region is expected to be the fastest growing market. By end user, homecare segment will be the largest contributor to the inhaler market during the forecast period.

The report covers:

Comprehensive research methodology of Global Inhaler market

This report also includes detailed and extensive market overview with key analyst insights.
