[Precast construction](#) is a type of construction, wherein pre cast (any material that is in its final shape before being positioned at its original location) construction structures are used.

Concrete, and steel in some cases, is generally used in precast construction. These structures are manufactured beforehand in a plant, which is located away from the actual construction site. These precast construction components are then transported and later assembled mechanically with the help of anchor bolts at the actual construction site. High early strength cement is cured with the help of steam curing and casts can be formed within a duration of 24 hours. Buildings can be constructed faster and at a much cheaper rates through precast construction. Components used for precast construction are generally standardized. This helps in providing better quality to structures as compared to site-cast concrete, as they are manufactured in a controlled condition. Precast construction components are more durable and hence can also be reused later. Controlled conditions while manufacturing precast allows better control of surface finishes. Compared to site-cast, precast construction components can be erected faster and are affected less by adverse weather conditions, making it comparatively safer.

Global Precast Construction market size will increase to xx Million US\$ by 2025, from xx Million US\$ in 2018, at a CAGR of xx% during the forecast period. In this study, 2018 has been considered as the base year and 2019 to 2025 as the forecast period to estimate the market size for Precast Construction.
