## Executive Summary

A fibre laser is a laser in which the active gain medium is an optical fibre doped with rare-earth elements such as erbium, ytterbium, neodymium, dysprosium, praseodymium, thulium and holmium. They are related to doped fibre amplifiers, which provide light amplification without lasing. fibre nonlinearities, such as stimulated Raman scattering or four-wave mixing can also provide gain and thus serve as gain media for a fibre laser.

In the coming years there is an increasing demand for Fibre Laser in the regions of North America and Europe that is expected to drive the market for more advanced Fibre Laser. Increasing of downstream industry fields expenditures, more-intense competition, launches in introducing new products, increasing of spending on general industry, retrofitting and renovation of old technology, increasing adoption of Fibre Laser will drive growth in China markets.
