Description

Since the rapid growth of the cloud computing, data collection and information sharing are led to a higher level and are replacing the traditional computation. Several technologies using cloud in all areas are developing to adapt the revolution of information technology and one of them is cloud gaming.

Scope of the Report:

In cloud gaming implementation, client-server structure is used to create a communication between front end and back end. User inputs are collected and delivered to cloud by UDP link and then data centre starts analysing incoming inputs and gives responses that can be either file stream or a video stream. In the next step, TCP connection receives packets and allocates them to each client. During the communication, required data is encoded into streams and decoded into frames in TCP connection so that video is shown to clients.

While the rapid growth of cloud gaming, challenges especially security risk, latency and bandwidth as well as packet loss are gradually arisen to impede technology developments. Benefits and impacts follow the appearance of cloud gaming and change the way players
