## Executive Summary

An ostomy, or stoma refers to the surgical procedure in which diseased portion of gastrointestinal or urinary system is removed, accompanied by artificial opening between the intestines and the abdominal wall for the discharge of body wastes. Depending on the part of the organ which require surgical intervention, ostomies are broadly divided into three categories-- colostomy (large intestine), ileostomy (small intestine) or urostomy (urinary bladder). Ostomy surgeries are life-saving procedures performed on patients suffering from various gastrointestinal diseases such as such as colorectal cancer, bladder cancer, Crohn's disease, ulcerative colitis, inflammatory bowel disease, fecal incontinence, etc.

Growth of the global ostomy products and accessories market is propelled by rising prevalence of colorectal cancer, higher incidences of Inflammatory Bowel Disease (IBD) & Crohn's Disease, growing geriatric population, increasing public awareness and higher healthcare expenditure. However, factors such as unstable reimbursement policies, social stigma, post-operative complications and presence of alternative surgical procedures are posing threat to growth of the market.
