

# Trends in Healthcare in 2019 with Himachal Mukhopadhyay

*2018 was a huge year for healthcare. The trends continue in 2019. Himachal Mukhopadhyay discusses.*

ROSEVILLE, CALIFORNIA, USA, May 15, 2019 /EINPresswire.com/ -- Healthcare is without a doubt one of the most important industries in the country. For the United States, the healthcare industry has been at the center of economical and social discussions for the better part of a decade, and it all came to a head in 2018 with a series of announcements of massive changes which shook the healthcare industry from the core upwards. This trend has continued into 2019, and we're now seeing the effects of these trends coming into effect. Below, with the help of [Himachal Mukhopadhyay](#), we're going to discuss what these trends are and what both patients and payers can expect as the year progresses.

## Digital adoption and robotic process automation

According to [Himachal Mukhopadhyay](#), robotic process automation and digital adaptation are changing the landscape of healthcare across the board. The reason for this has to do with the fact that robotic process automation allows professionals to automate low-level tasks so that they can reserve their concentration for higher-level, more complex tasks. These tasks include inputting data and other monotonous, routine jobs. It is hoped that this will allow doctors and other medical professionals to free up their time for more pressing, engaging and intellectually heavier work.

## Electronic medical records

According to Himachal Mukhopadhyay, electronic medical records of EMRs, have been quite widespread and available for sometime now, so the acquisition and introduction of them is nothing new. However, throughout 2019 we're going to start seeing some of the benefits of having EMRs around. This means that doctors will instantly have access to a patient's medical history at the touch of the finger, enabling them to provide better, more-informed healthcare than they would have been previously able to.

## Artificial intelligence

AI is the buzzword on everyone's lips, and that includes the healthcare industry. According to Himachal Mukhopadhyay, recent progressions in artificial intelligence are set to have a massive impact on the healthcare industry. For example, in countries where doctors aren't readily available, artificial intelligence will be able to be used in order to accurately diagnose patients in

the absence of trained professionals.

Enhanced focus on security and compliance

As with many other processes in 2019, there has been an increased focus on enhancing security and compliance throughout the healthcare industry. As data becomes an evermore valuable commodity, pains must be taken to keep this data safe. This is especially true for doctors who wish to communicate swiftly and securely while still adhering to compliance. Because compromised systems can also cause a complete failure of a healthcare electronic records system, it's imperative that security and compliance to regulations are the strongest they can possibly be.
