## Report Description:

Needle free injection technology (NFIT) is an extremely broad concept which includes a wide range of drug delivery systems that drive drugs through the skin using any of the forces as Lorentz, Shock waves, pressure by gas or electrophoresis which propels the drug through the skin, virtually nullifying the use of hypodermic needle. This technology is not only touted to be beneficial for the pharma industry but the developing world too finds it highly useful in mass immunization programmes, bypassing the chances of needle stick injuries and avoiding other complications including those arising due to multiple use of single needle.

Needle-based Injections continue to be the primary option for the delivering large molecule drugs which would break down in the gastrointestinal tract if consumed orally. Despite their common use, needles have several drawbacks including but not limited to needle stick injuries, patient non-compliance and needle phobia. Furthermore, needles can be a source of disease transmission, particularly when they are re-used and used incorrectly.

This report focuses on the global Needle-Free Drug Delivery status, future forecast, growth opportunity, key market and key players. The study objectives are to present the Needle-Free Drug Delivery development in United States, Europe and China.
