TB is an infectious bacterial disease caused by *Mycobacterium tuberculosis*. It is communicable and can be transmitted from one person to another. TB is one of the world's deadliest communicable diseases. In 2013, there were 9 million new TB cases and 1.5 million TB deaths, out of which 1.1 million among HIV-negative people and 0.4 million among HIV-positive people. The tuberculosis diagnostics kit has undergone tremendous technological advancement to give better accuracy, quick results, and available at low cost. For the purpose of this study, the global tuberculosis diagnostics market is segmented into test types which includes radiographic methods, laboratory methods, nucleic acid testing, phage assay, cytokine detection test, detection of drug resistance, and Mantoux test.

In base year 2017, laboratory methods are leading the types segment due to rising prevalence of tuberculosis, easy collection of specimen sample and available at low cost. Nucleic acid testing, cytokine detection test segment is anticipated to register faster growth in the test types segment throughout the forecast period 2017-2023, as it is providing greater accuracy and requires less incubation period for the interpretation of the results. In 2017 Asia Pacific region dominated the tuberculosis diagnostics market due to factors such as large patient pool suffering with tuberculosis, government and non-government initiatives to eradicate tuberculosis and high disposable income in these regions.
