The traditional role of compounding pharmacies is to make drugs prescribed by doctors for specific patients with needs that can't be met by commercially available drugs. For example: A young child may need a small, liquid dose of a drug made only in adult-dosage tablets. A person may be allergic to one of the ingredients in the commercial version of a drug. A compounding pharmacy would make the proper dosage and form of the drug without any offending ingredients.

Compounded medications are made based on a practitioner's prescription in which individual ingredients are mixed together in the exact strength and dosage form required by the patient. This method allows the compounding pharmacist to work with the patient and the prescriber to customize a medication to meet the patient's specific needs.

The classification of Compounding Pharmacy includes pharmaceutical ingredient alteration (PIA), pharmaceutical application alteration (PAA), currently unavailable pharmaceutical manufacturing (CUPM), pharmaceutical dosage alteration (PDA) and specialized animal pharmaceutical manufacturing (SAPM), the proportion of Pharmaceutical ingredient alteration (PIA) in 2017 is about 34%.
