Description

Bone grafts are implantable materials that promote bone healing, bone formation, and osseous reconstruction due to its osteoconductive, osteogenic, and osteoinductive properties. Bone grafting is a surgical procedure for replacing a missing or defected bone with a material (bone graft) from a patient's own body, cadaver, animals, or a different person. Bone grafts are used in sports, trauma plastic, facial, and spinal surgery. Bone grafting finds its application in wound healing and complex fracture treatment, among others. Bone grafts can also be used to fill voids in case of absence of bones or help in provision of structural stability.

Increase in incidence of bone & joint disorders, technological advancements in medical field, development of biocompatible synthetic bone grafts, increase in demand for dental bone grafts drive the market growth. However, high cost of surgeries and ethical issues related to bone grafting procedures hamper the market growth. Conversely, increase in focus of key players towards R&D activities in bone grafts and its substitutes and upsurge in demand for orthopedic procedures among geriatric population are expected to provide lucrative opportunities for the market players in the future.
