

High Aluminum Levels Contaminate Brains of Autistic Children

U.K. researchers found the brain tissue of deceased autistics contained high levels of aluminum. This begs the question, are vaccines the source?

WASHINGTON, DC, US, June 4, 2019 /EINPresswire.com/ -- Washington, DC—June 4, 2019—High concentrations of aluminum characterize the brains of autistic children, according to a [2018 study published](#) in the Journal of Trace Elements in Medicine and Biology. [1]

Researchers from Keele University in the U.K. examined brain tissue from deceased individuals with a diagnosis of autism, finding some of the highest values for aluminum in human brain tissue yet recorded. The research investigated brain tissue from ten donors, representing all donors available at the Autism Brain Bank, and a standout observation was the location of aluminum in primarily inflammatory, non-neuronal, cells with evidence of these cells moving from blood and lymph into brain tissue.

Government assurances that vaccines don't cause autism cannot hold up to this new discovery."

Sally Fallon Morell

Sources of ingested aluminum include infant formula, foods in aluminum packaging, and foods cooked in aluminum pans or foil. However, in general, less than 1 percent of dietary aluminum is absorbed.[2] A highly probable source of aluminum in the brains of autistic children is vaccines. A fully vaccinated child receives almost 5,000 mcg aluminum by 18 months of age. [3] The amount of aluminum in the eight doses given at the two-month baby check-up is 1,225 mcg. [3] By contrast, the maximum

allowable aluminum per day for intravenous feeding in children is 25 mcg.

U.S. vaccines containing one or more types of aluminum include diphtheria, tetanus and pertussis (ST, DTAP, Td, Tdap); influenza type b (Hib); hepatitis (A and B, A/B); the meningococcal and pneumococcal vaccines; and human papillomavirus (HPV). All of these vaccines are on the CDC vaccine schedule. Babies routinely receive the hepatitis B vaccination on the first day of life.

Aluminum compounds in vaccines include aluminum hydroxide, aluminum phosphate, "aluminum salts," amorphous aluminum hydroxyphosphate sulfate (AAHS), and potassium aluminum sulfate.[4] Merck's proprietary AAHS adjuvant (added to the Gardasil Hib and Hepatitis

A and B vaccines) was not safety tested and is among the components blamed for the adverse reactions to the Gardasil [5] as well as hepatitis vaccines.

“Government assurances that vaccines don’t cause autism cannot hold up to this new discovery,” says Sally Fallon Morell, president of the Weston A. Price Foundation. “Parents are right to hesitate before injecting neuro-toxic aluminum into their children.”

One of the unique risks associated with aluminum adjuvants is an extreme autoimmune or inflammatory response. Israeli immunologist, Yehuda Schoenfeld and his colleagues dubbed this condition, “autoimmune/inflammatory syndrome induced by adjuvants” (ASIA) and it can now be tracked in medical databases. The symptoms of ASIA include chronic fatigue, muscle and joint pain, sleep disturbances, cognitive impairment and skin rashes. [6]

The Weston A. Price Foundation is a Washington, DC-based nutrition education 501(c)(3) with the mission of disseminating science-based information on diet and health. WAPF publishes a quarterly journal for its 12,000 members, supports almost 500 local chapters worldwide and hosts a yearly international conference.
