Automobiles may still be running on four wheels, but they now come with numerous advanced features which have transformed the overall experience of driving. Just like any other industry, the automotive industry too has gone through a tremendous transformation. It has sailed through high tides of exorbitant fuel prices, issues associated with metal body parts, design complexities, as well as technological failures. Currently, the industry has overcome the host of problems to enhance end-user experience and is poised for remarkable growth. OEMs have shifted their business models and adopted a more customer-centric approach and embraced

technological innovations such as electrification and are moving towards autonomous capabilities which have provided significant thrust to the industry.

Autonomy in driving is also happening at about the same time as vehicle electrification. How autonomous vehicles will change travel has become the key area of research for various bodies. Autonomous vehicles are among the landmark achievements for the automotive and robotics industry, which is the result of intensely focused development and infinite hours and testing and validation. However, it is indeed an uphill task to achieve full autonomy in driving. Designing and building a perception control system that is capable of driving better than the average human driver has become the key area of focus for major automakers in the world. The debate over the uncertainties and technical challenges surround autonomous driving technology. However, automakers and technology involved in the development of the technology are optimistic about its future applications.
