The chemicals sector caters to numerous sectors such as food & beverages, energy & power, automotive, and others. Bulk chemicals, specialty chemicals, tapes, adhesives, sealants, and elastomers are some of the major categories covered in the sector. The sector suffers from a paucity of raw materials due to a lag in transportation or changing political scenarios. Chemicals are the basis of various products such as medicines, rubber, foods, beverages, and others. Plastics is one of the booming sub-sectors which has enjoyed immeasurable success.

Basic chemicals are manufactured massively for continuous production of detergents, soaps, perfumes, and other personal care items. The mandatory compliance of stringent policies and safety tests can hamper innovation. Industry leaders have outsourced their research and development to contract research outsourcing companies. This alleviates the pressure on companies, allowing them to focus on mass production. Companies with diverse portfolios are rearranging their schedule and operation methods to expedite their production rate. Chemical producing companies can catch tailwind thanks to the constant supply of shale gas-driven feedstock.

The long disposal rate of chemicals has led to the passing of stringent laws and policies limiting its use in long scale production. But lax regulations in some countries has led to its inclusion in the production of thermoplastics and polymers. To combat heavy fines, companies have invested in the production of bioplastics which are derived from natural or organic sources. This can lead to the production of lightweight components, insulation materials, and lowered carbon emission rates. Cities are expanding their budgets to allot vacant sites for industrial composting which can be used for successful disposal of bioplastics. Furthermore, the development of biomaterials have been used for packaging solutions of frozen and packaged foods.
